

MAXIMUM PERMISSIBLE EXPOSURE FOR SUBPART C 2.4 GHz BAND**Calculations**

Power density at the specific separation:

$$S = PG/(4R^2\pi)$$
$$S = (1.45 * 0.871) / (4 * 1^2 * \pi)$$
$$S = 0.1005 \text{ mW/cm}^2 \text{ (at 1 cm)}$$
$$\text{Limit} = 1 \text{ mW/cm}^2$$

where

S = Maximum power density (mW/cm²)
P = Power input to the antenna (mW) – 1.60 dBm
G = Numeric power gain of the antenna
R = distance to the center of the radiation of the antenna (1 cm = limit for MPE)

The maximum permissible exposure (MPE) for the general population is 1 mW/cm².

The power density at 1 cm does not exceed the 1 mW/cm². Therefore, the exposure condition is compliant with FCC rules.

The numeric gain (G) of the antenna with a gain specified in dB is determined by:

$$G = \text{Log}^{-1}(\text{dB antenna gain}/10)$$
$$G = \text{Log}^{-1}(-0.6 \text{ dBi}/10)$$
$$G = 0.871$$
