Tests supervised by:

Valdis V. Liepa Report approved by:

Valdis V. Liepa Research Scientist

Summary

Tests for compliance with FCC Regulations, Part 15, Subpart C, and for compliance with Industry Canada RSS-210, were performed on Motorola RKE transmitter. This device is subject to the Rules and Regulations as a transmitter and as a digital device.

In testing performed on October 3, 2001, the device tested in the worst case met the allowed specifications for radiated emissions by 3.6 dB at the fundamental and by 20.2 dB at the harmonics (see p. 6). Besides harmonics, there were no other significant spurious emissions found; emissions from digital circuitry were negligible. The line conducted emission tests do not apply, since the device is powered by a 3-volt battery.

1. Introduction

Motorola GTM800 RKE Transmitter, Model LHJ011, was tested for compliance with FCC Regulations, Part 15, adopted under Docket 87-389, April 18, 1989, and with Industry Canada RSS-210, Issue 2, dated February 14, 1998. The tests were performed at the University of Michigan Radiation Laboratory Willow Run Test Range following the procedures described in ANSI C63.4-1992 "Methods of Measurement of Radio-Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the Range of 9 kHz to 40 GHz". The Site description and attenuation characteristics of the Open Site facility are on file with FCC Laboratory, Columbia, Maryland. (FCC file 31040/SIT) and with Industry Canada, Ottawa, ON (File Ref. No: IC2057).

2. Test Procedure and Equipment Used

The pertinent test equipment commonly used in our facility for measurements is listed in Table 2.1 below. The middle column identifies the specific equipment used in these tests.

3. Configuration and Identification of Device Under Test

The DUT is a hand held three-button low power RKE transmitter designed to send identification and control signals to a companion receiver. It is activated by depressing any of the buttons. When the transmitter is activated by momentary push, it transmits two words for about 135 ms. If the button is kept depressed, there is no additional transmission. The emission is Manchester encoded format, ASK modulated on a 315.0 MHz carrier. The DUT was designed and manufactured by Motorola, Inc., Automotive and Industrial Electronics Group, 4000 Commercial Ave., Northbrook, IL 60062-1840. It is identified as:

Motorola GTM800 RKE Transmitter Model: LHJ011 S/N: 091801N FCC ID: LHJ011 CANADA:

There were two transmitters submitted and used in testing. The (modified) continuous data version (SN: 091101C) was used in fundamental and harmonic emission measurements, and the normal version was used for other measurements.

3.1 EMI Relevant Modifications

No modifications were made to the DUT by this laboratory.

4. Emission Limits

4.1 Radiated Emission Limits

The DUT tested falls under the category of an Intentional Radiators and the Digital Devices. For FCC, it is subject to Part 15, Subpart C, (Section 15.231), Subpart B, (Section 15.109), and Subpart A, (Section 15.33). For Industry Canada it is subject to RSS-210, (Sections 6.1 and 6.3). The applicable testing frequencies with corresponding emission limits are given in Tables 4.1 and 4.2 below. As a digital device, the DUT is considered as a Class B device.

Table 4.1. Radiated Emission Limits (FCC: 15.33, 15.35, 15.109; IC: RSS-210, 6.2.2(r)). (Digital Class B)

Freq. (MHz)	E _{lim} (3m) μV/m	E _{lim} dB(μV/m)
30-88	100	40.0
88-216	150	43.5
216-960	200	46.0
960-2000	500	54.0

Note: Average readings apply above 1000 MHz (1 MHz BW) Quasi-Peak readings apply to 1000 MHz (120 kHz BW)

Table 4.2. Radiated Emission Limits (FCC: 15.231(b), 15.205(a); IC: RSS-210; 6.1, 6.3). (Transmitter)

Frequency	Fundan Ave. E _{li}		Spurious** Ave. E _{lim} (3m)

^{*} Linear interpolation, formula: E = -7083 + 41.67*f (MHz)

4.2 Conductive Emission Limits

The conductive emission limits and tests do not apply here, since the DUT is powered by one internal 3-volt battery.

5. Radiated Emission Tests and Results

5.1 Anechonic Chamber Measurements

To familiarize with the radiated emission behavior of the DUT, the DUT was first studied and measured in a shielded anechoic chamber. In the chamber there is a set-up similar to that of an outdoor 3-meter site, with a turntable, an antenna mast, and a ground plane. Instrumentation includes spectrum analyzers and other equipment as needed.

In testing for radiated emissions, the transmitter was activated using the lock/unlock button with a special wooden clamp for repeated pulse emissions. It was placed on the test table flat, on its side, or on its end.

In the chamber we studied and recorded all the emissions using a bicone antenna up to 300 MHz and a ridged horn antenna above 200 MHz. The measurements made in the chamber below 1 GHz are used for pre-test evaluation only. The measurements made above 1 GHz are used in pre-test evaluation and in the final compliance assessment. We note that for the horn antenna, the antenna pattern is more directive and hence the measurement is essentially that of free space (no ground reflection). Consequently it is not essential to measure the DUT for both antenna polarizations, as long as the DUT is measured on all three of its major axis. In the chamber we also recorded the spectrum and modulation characteristics of the carrier. These data are presented in subsequent sections. We also note that in scanning from 30 MHz to 3.15 GHz using bicone and the ridge horn antennas, there were no other significant spurious emissions observed.

^{**} Measure up to tenth harmonic; 120 kHz BW up to 1 GHz, 1 MHz BW above 1 GHz

5.2 Outdoor Measurements

After the chamber measurements, the emissions were re-measured on the outdoor 3-meter site at fundamental and harmonics up to 1 GHz using tuned dipoles and/or the high frequency bicone.

Photographs in Appendix (at end of this report) show the DUT on the open in site table (OATS).

5.3 Computations and Results

To convert the dBm measured on the spectrum analyzer to dB(μ V/m), we use expression

$$E_3(dB\mu V/m) = 107 + P_R + K_A - K_G + K_E$$

where

P_R = power recorded on spectrum analyzer, dB, measured at 3m

 K_A = antenna factor, dB/m

 K_G = pre-amplifier gain, including cable loss, dB K_E = pulse operation correction factor, dB (see 6.1)

When presenting the data, at each frequency the highest measured emission under all of the possible orientations is given. Computations and results are given in Table 5.1. There we see that the DUT meets the limits by 3.6 dB.

6. Other Measurements and Computations

6.1 Correction For Pulse Operation

When the transmitter is activated by momentary push, it transmits two ASK encoded (repeated) words. When a button is kept depressed, there is no additional transmission. Manchester format coding is used: ones and zeros are encoded as low-high, high-low transitions. Thus all the bits are of same width of 50 percent. When a pulse appears wide, that is a result of two adjacent highs. See Fig. 6.1 for recorded ASK pattern. The "worst case" duty factor is when the 100 ms window includes the first pulse and a part of the second pulse. In computation we subtract the dead time from the 100 ms and take 50 percent of the result. The duty factor is then

$$K_E = (100.0-34.78)/(100.0 \times 2) = 0.326 \text{ or } -9.7 \text{ dB}.$$

6.2 Emission Spectrum

Using the ridge-horn antenna and DUT placed in its aperture, emission spectrum was recorded and is shown in Figure 6.2.

6.3 Bandwidth of the Emission Spectrum

The measured spectrum of the signal is shown in Figure 6.3. The allowed (-20 dB) bandwidth is 0.25% of 315 MHz, or 787.25 KHz. From the plot we see that the -20 dB bandwidth is 87.0 kHz, and the center frequency is 314.97 MHz.

6.4 Effect of Supply Voltage Variation

The DUT has been designed to be powered by 3 VDC battery. For this test, the battery was replaced by a laboratory variable power supply. Relative power radiated was measured at the fundamental as the voltage was varied from 2.5 to 4.0 volts. The emission variation is shown in Figure 6.4.

6.5 Input Voltage at Battery Terminals

Batteries:

before testing $V_{oc} = 3.05 \text{ V}$

after testing

 $V_{oc} = 2.94 \text{ V}$

Ave. current from batteries

I = 6.4 mA (pulsed)
