Operational Circuit Description

MT-2 is a control signal encoder integrated circuit that generates control singals when the user presses the control keys. Then control signal is amplified by Q1 and modulated to a high frequency signal,which generated from oscillator composed by Q2 and X1. Modulated signal is then coupled through the filter composed by C1,C7 and L1 to antenna.

Power supply and Ground

One 9V battery is the only power supply for the transmitter. No external power is needed.
