4.1 EUT description

The EUT is a triple band (GSM 900/1800/1900, E-GPRS) GSM phone.

The EUT was not modified during the tests.

5 EUT TEST SETUPS

For each test the EUT was exercised to find out the worst case of operation modes and device configuration.

The test setup photographs are in the document referenced in section 8.

6 APPLICABLE STANDARDS

The tests were performed in guidance of CFR 47 part 24, part 2, ANSI/TIA/EIA-603-A and RSS-133. Deviations, modifications or clarifications (if any) to above mentioned documents are written in each section under "Test method" for each test case.

7.1 Test setup

The EUT was set on a non-conductive turn table in a semi anechoic chamber. In the corner of the chamber there was a communication antenna, which was connected to the BS simulator located outside the chamber. The radiated power from the EUT was measured with an antenna fixed to a antenna tower. The tower and turn table were remotely controlled to turn the EUT and change the antenna polarization. The measured signal was routed from the measuring antenna to the spectrum analyzer. The BS simulator was used to set the TX channel and power level and modulate the TX signal with different bit patterns.

7.2 Test method

- The maximum power level was searched by moving the turn table and measuring antenna and manipulating the EUT. This level (P_{EUT}) was recorded.
- The EUT was replaced with a substituting antenna.
- The substituting antenna was fed with the power (P_{Subst_TX}) giving a convenient reading on the spectrum analyzer. That reading (P_{Subst_RX}) on spectrum analyzer was recorded.

7.3 EUT operation modes

7.4 Limit

EIRP [W]
≤ 2

7.5 Results

The formula below was used to calculate the EIRP of the EUT.

$$P_{EIRP[W]} = \frac{10^{(P_{Subst_TX[dBm]} + (P_{EUT[dBm]} - P_{Subst_RX[dBm]}) + G_{Substitute_antenna[dBi]} - L_{Cable[dB]}) / 10}}{1000}$$

where the variables are as follows:

P_{EUT} [dBm]	Measured power level (from step a in 7.2) from the EUT
P_{Subst_TX} [dBm]	Power (from step c in 7.2) fed to the substituting antenna
P_{Subst_RX} [dBm]	Power (from step c in 7.2) received with the spectrum analyzer
$G_{Substitute_antenna}$ [dBi]	Gain of the substitutive antenna over isotropic radiator
L_{Cable} [dB]	Loss of the cable between signal generator and the substituting antenna
