4. Equipment under test description.

*The customer provided description.

4.1 General description

BreezeMAX 4M 2.5GHz is digital modulated TDD system operating in the 2500MHz up to 2700MHz band. The system contains a base station unit and a subscriber unit.

The basic system configuration is a two-box configuration that contains

1. Indoor unit that contains the IF unit, digital card, power supply and modem.
2. Outdoor unit contain the radio {Basic + HPA} and digital control section unit.

The outdoor unit (ODU) is a high-power, multi-carrier radio unit that connects to one or more external antennas. The ODU is designed to provide high system gain and interference robustness utilizing high transmit power and low noise figure. It is HW-ready for supporting a bandwidth of up to 20 MHz, enabling future options such as increased capacity through the use of a multiplexer or wider frequency channels.

4.1.1 Environmental evaluation and exposure limit according to FCC CFR 47 part 1, §1.1307, §1.1310

Limit for power density for general population/uncontrolled exposure is $1(\text{mW}/\text{cm}^2)$ or $10 (\text{W}/\text{m}^2)$.

The power density calculation $S = (Pt / 4\pi r^2)$.

Where

Pt - The transmitted power (EIRP) (mW)

r - The distance from the unit. (cm)

The $1(\text{mW}/\text{cm}^2)$ limit can be calculated from the above based on the following data:

Pt- the transmitted power which is equal to the output power 38.3 dBm plus external antenna gain 18 dBi. The maximum EIRP = 56.3 dBm = 426579 mW

Minimum allowed distance from antenna were FCC RF exposure limit may not be exceeded

$r = \text{SQRT}(426579/4\pi) = 1.85 \text{ m}$.

2640.0	38.0	56.0	72.6	#11
2685.0	38.3	56.3	72.6	#12

The maximum EIRP in dBW in a given direction shall be determined by the following formula:
 $EIRP = 33 \text{ dBW} + 10 \log(X/Y) \text{ dBW} + 10 \log(360/\text{beamwidth}) \text{ dBW}$, where X is the actual channel width in MHz, Y is 6 MHz.

For 5 MHz channel spacing $EIRP = 33 \text{ dBW} + 10 \log(5/6) + 10 \log(360/65^\circ) = 69.6 \text{ dBm}$

For 10 MHz channel spacing $EIRP = 33 \text{ dBW} + 10 \log(10/6) \text{ dBW} + 10 \log(360/65^\circ) = 72.6 \text{ dBm}$.

According to standard requirements power spectral density in any 100 kHz segment of the channel bandwidth is limited to EIRP power/ (bandwidth/RBW).

For 5 MHz channel spacing $2000W/50 = 40W$. At antenna terminal $46dBm - 18 dB = 28dBm$.

For 10 MHz channel spacing $2000W/100 = 20W$. At antenna terminal $43dBm - 18 dB = 25dBm$.

Operating Frequencies Range 2592.5 – 2687.5 MHz
 Ambient Temperature 22⁰ C Relative Humidity 52% Air Pressure 1007 hPa

TEST PROCEDURE

The frequency spectrum was investigated from the lowest radio frequency signal generated in the equipment, without going below 9 kHz, up to the tenth harmonic of the highest fundamental frequency. The emission levels of the EUT more than 20 dB lower than the specified limit were not recorded in the tables. For the test results refer to Plots in this section.

Substitution method

The measurements were performed according to ANSI/TIA-603-C-2004 section 2.2.12 test method. Transmitter was operated with internal antenna in 3 carrier frequencies at low; middle and high point of the band. Investigation of transmitter spurious emissions was performed. EUT was replaced by generator and substitution antenna. Level calculated from generator output level, substitution antenna gain and connected cable loss was compared with the limit.

LIMIT

For operation in the declare 2590 – 2690 band, the power of any emissions outside the authorized frequency ranges of operation shall be attenuated below the transmitter power (P) measured in watts by a factor not less then $43+10\text{Log}(P)$ dB = -13 dBm@ 82.2 dBµV/m at 3m distance.

TEST SUMMARY

No emissions were found closer than 20 dB to FCC p.27.53 specified limit except presented the worse case result for:
 Frequency carrier 2687.5 MHz at 2690 MHz is 3.9 dB under the limit in plot #77.
 Frequency carrier 2640 MHz at 2645 MHz is 7.1 dB under the limit in plot #85.
 The emissions in the 6.5 – 27 GHz band were found below the spectrum analyzer noise level which is at least 40 dB below the limit.

TEST PROCEDURE

The EUT was placed in a climatic chamber and allowed to stabilize at 20°C temperature and nominal voltage for at list 15 min. The reference carrier frequency was taken. The input voltage was changed from 85% of nominal to 115%. Frequency changes were noted. The temperature in climatic chamber was varied from -30°C to +50°C. Measured frequencies were noted in table above.

LIMIT

The frequency stability shall be sufficient to ensure that the fundamental emissions stay within the authorized frequency bands of operation.

TEST SUMMARY

Transmitter carrier frequency stay within the authorized frequency bands 2590 – 2690 MHz.

5.2 Radiated emissions test according to § 15.209

Method of measurement	ANSI 63.4 §13.1.4			
Ambient Temperature	24 ⁰ C	Relative Humidity	55%	Air Pressure 1009 hPa

TEST DESCRIPTION:

The measurements were performed at the Open Area Test Site. The test configuration is shown in Fig.1. The EUT was arranged on a wooden table 0.8 m placed on the turn - table. The measurements were performed at a 10 m measurement distance. The Biconilog 30 MHz-2 GHz antenna was used. The frequency range was investigated from 30 MHz to 1 GHz. The measurements were performed at each frequency at which the signal was 10 dB below the limit or less. The level was maximized by initially rotating turntable through 360°, varying the antenna height between 1 m and 4 m, rerouting EUT cables and changing antenna polarization from vertical to horizontal.

REQUIREMENTS:

EUT radiated emission shall not exceed value required in section 15.209

TEST RESULT:

Test results are presented in Table 1.
Results more than 20 dB under the limit were not inserted in the table #1.

TEST PROCEDURE

EUT was placed on a wooden table in a shielded chamber at a height of 80 cm from the floor and 40 cm from the vertical reference plane. The measurements were performed at mains terminals by means of LISN, connected to spectrum analyzer in the frequency range as referred to in the table above. The measurements were made with quasi-peak (CISPR) detectors under limit average. The position of the EUT cables was varied to determine maximum emission level.

TEST RESULT:

Test results are shown at plots ## 91 for line +48VDC and 92 for line -48VDC.
