Att. Avner Ruta

Dear Avner,

According to your request per radio Test reports 8612337013, 8612329133 and 8612337012 we would like to inform you that:

Radiated emissions tests according to part 27.53 were performed by substitution method. The limit on the plots is limit EIRP converted to field strength limit at relevant distance and correlated by substitution procedure.  
For example: EIRP limit  $43 + 10 \cdot \log P = -13$  dBm was converted to 82.2 dB $\mu$ V/m field strength limit at 3m test distance. In bands where spurious emissions peaks were found below limit close than 10 dB test result was got by substitution method.

Best regards.

Name: Eng. Yuri Rozenberg

Position: Head of EMC Branch
