FCC ID: LKT-BULTRA-5

1) ATPC will be implemented in production units in accordance to 15.407(h) and 15.403(r).

BreezeUltra units have the ability to switch between several power levels according to necessity. (15.403r)

ATPC function is implemented and can be used on all available power levels of our unit. In the inferior power range, it can reach the required level of 6 dB below 30 dBm mean EIRP (15.407h).

2) Since the reviewed GUI is a pre-release version, the company agrees to include in the production version GUI three FCC configuration options only for US installations: 5.4 GHz, 5.8 GHz P2MP, and 5.8 GHz P2P, and that all three options will include only authorized channels and authorized output power levels.

Alvarion built a mechanism of locking the regulatory domain to specific ranges together with special part numbers for the product catalog number. For US part numbers, the unit can accept only FCC compliant country codes. Configuring a non-compliant country code on a US part number is prevented in all management interfaces available to the final user. For the GUI, similar to the rejection of any non-compliant country code, the list available for selection is restricted to the legal options only. At this moment, the list includes the following country codes: 5.4 GHz FCC; 5.8 GHz FCC P2MP; 5.8 GHz FCC P2P. Those country codes contain only authorized channels and output power levels. If it will be necessary to alter this area in the future, it will happen according to permissive changes allowed by the FCC.

3) The current installation manual does not have a list of maximum power levels and antenna options for the three FCC configurations due to the software for P2MP mode not ready for release. The company agrees to add instructions in the user's manual limitations of power setting and antenna gain options at time of product release.

Alvarion took notice of this request and is committed that together with the versions that will enhance capabilities of the BreezeUltra family, it will document and publish all the necessary information to the final user to enable him to maintain legality. This includes publishing in the user manual the allowed combinations of power levels and antenna gains for the relevant working modes.
