Electromagnetic Compatibility
Test Report

Test Report No: AVR 070811
Issued on: August 07, 2011

Product Name
Remote Unit 2308

Tested According to
FCC 47 CFR, Part 22

Tests Performed for
Alvarion Ltd.
21A Habarzel street,P.O.Box 13139 Ramat Hachayal 61131 Tel Aviv, Israel

Test Report details:

Issued on: 07.08.2011

Assessment information:

This report contains an assessment of the EUT against Electromagnetic Compatibility based upon tests carried out on the samples submitted. The results contained in this report relate only to the items tested. Manufactured products will not necessarily give identical results due to production and measurement tolerances. QualiTech, EMC Lab does not assume responsibility for any conclusion and generalization drawn from the test results with regards to other specimens or samples of type of the equipment represented by test item.

The EUT was set up and exercised using the configuration, modes of operation and arrangements defined in this report only.

Modifications:

Modifications made to the EUT

None.

Modifications made to the Test Standard

None.

Summary of Compliance Status

Test Spec. Clause	Test Case	Remarks
§22.913(a)(2) & §2.1046	RF Power Output, Conducted	**Pass**
§22.355 & §2.1055	Frequency Stability	**Pass**
§22.917(b) & §2.1049	Occupied Bandwidth	**Pass**
§22.917(a) & §2.1053	Out of Band Emissions - radiated	**Pass**
§22.917(b) & §2.1051	Out of Band Emissions and Inter-modulation – Conducted	**Pass**
§22.917(b)	Block Edge Emissions and Inter-modulation - conducted	**Pass**

Table of Contents

1. General Description

Description of the EUT system/test Item:

Product name: Remote Unit 2308

Model: 2308

EUT Description:

The **Remote Unit 2308** resides in the customer's location (home, hotel-room, etc.). The purpose of the **Remote Unit 2308** is taking the RF signals that propagated via the cables, convert it to the native wireless frequency and transmit it to the air inside the customer's location. The **Remote Unit 2308** connects to the cable outlet and receives power from the electrical grid. The **Remote Unit 2308** contains a miniature inverse UDC for frequency conversion, a transmitter and an antenna. The **Remote Unit 2308** comes in two power ratings:

- 0 dBm
- 15 dBm

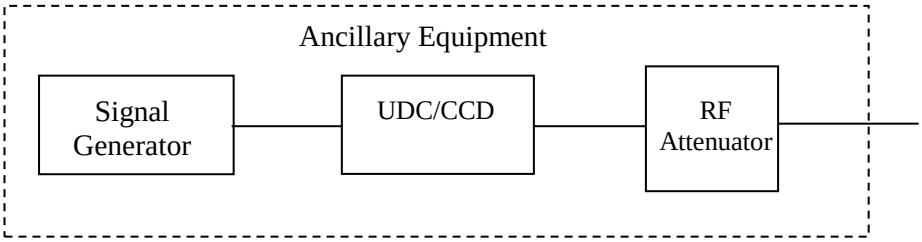
Bands and Modulations:

Mode	Direction	Modulation	Frequency Band	Maximum Output Power
GSM	Downlink	GMSK	1930 - 1990 MHz	15.0 dBm
EDGE	Downlink	8PSK		15.0 dBm
CDMA 2000	Downlink	CDMA 2000		15.0 dBm
CDMA 2000-1xEVDO	Downlink	CDMA 2000-1xEVDO		15.0 dBm

Mode	Direction	Modulation	Frequency Band	Maximum Output Power
GSM	Downlink	GMSK	869 - 894 MHz	15.0 dBm
EDGE	Downlink	8PSK		15.0 dBm
CDMA 2000	Downlink	CDMA 2000		15.0 dBm
CDMA 2000-1xEVDO	Downlink	CDMA 2000-1xEVDO		15.0 dBm

Ancillary Equipment

For the purposes of this test report, ancillary equipment is defined as equipment which is used in conjunction with the EUT to provide operational features to the EUT.
The system was configured in a typical fashion, as it would be normally used. However, the ancillary equipment can influence the test results.



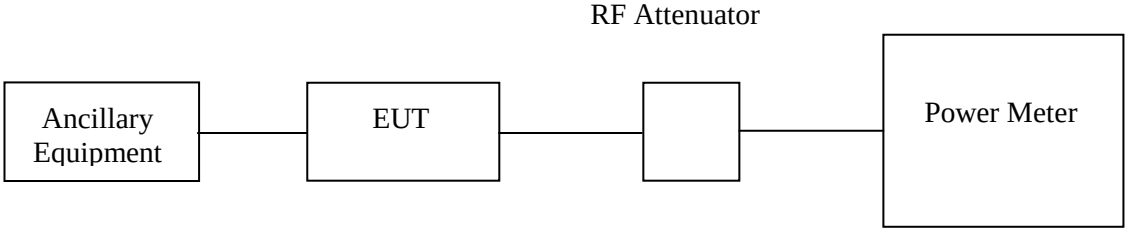
2. Method of Measurements

2.1. Conducted RF Power Output Measurements:

The ancillary equipment is configured to generate continuous signals with PRBS data modulation.

The transmitter output was connected to the Peak Power Meter via an RF attenuator, and the output power of the EUT was adjusted to be 15dBm as this was the maximum expected output power for all frequencies and modulations including system tolerance.

Test Setup # 2.1



2.2. Radiated Out of Band Emissions Measurements:

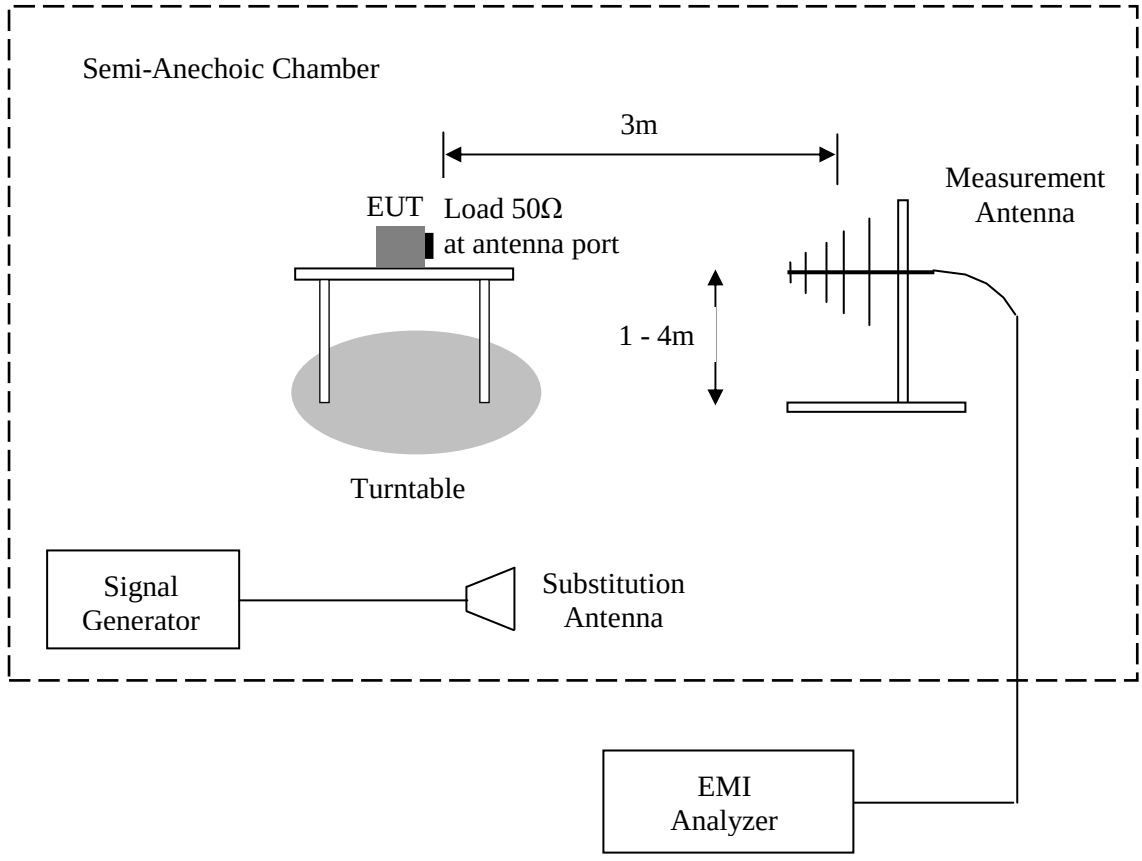
The ancillary equipment was configured to generate CW signals, and the output power of the EUT is adjusted to be 15dBm.

The antenna output was terminated with 50 Ω load and measurements made to detect spurious emissions that may radiate directly from the cabinet, control circuit, power leads under normal conditions of installation and operation.

The spectrum was investigated from 30MHz to the 10th harmonic of the highest frequency generated within the EUT, which is the transmitted carrier that can be as high as 894MHz. For each spurious frequency, the antenna mast was raised and lowered from 1 to 4 meters and the turntable is rotated 360degrees to obtain a maximum reading on the spectrum analyzer. The maximum reading was recorded. The amplitude of spurious emissions which are attenuated more than 20dB below the permissible value need not be reported. Radiated emissions measurements are made at the upper, mid, and lower carrier frequencies of the 850/1900 bands.

After all spurious emissions were recorded; the antenna substitution method is used to determine the equivalent radiated power at spurious frequencies. The EUT was replaced with a substitution antenna with a known gain, fed by a signal generator, in accordance to TIA/EIA 603. With the signal generator tuned to a particular spurious frequency, the antenna mast was raised and lowered from 1 to 4 meters to obtain a maximum reading on the spectrum analyzer. The signal source level was adjusted to repeat the previously measured level. The power readings in dBm should be corrected for the cable loss, and compared to the §22.917(a) limits.

EIRP Emission [dBm] = Measured [dBm] - Cable Loss [dB] + Substitution Antenna Gain [dBi]
ERP can be calculated from EIRP by subtracting 2.1dBi.



2.3. Conducted Spurious Emissions at antenna terminal Measurements:

The ancillary equipment was configured to generate continuous signals with PRBS data modulation, and the output power of the EUT was adjusted to be 15dBm.

The transmitter output was connected to the input of the Spectrum analyzer through an attenuator. The external attenuators and cable loss were added to the reading.

For spurious emissions measurement, the spectrum from the lowest radio frequency generated in the equipment up to the 10th harmonic of the carrier frequency, rounded to 20GHz was investigated with the transmitter set to the lowest, middle and highest channel frequencies.

For Block Edge measurements in 1MHz bands immediately outside and adjacent to the frequency block, conducted emissions were measured using a RBW of at least 1% of the occupied BW.

For inter-modulation measurements, two modulated signals were combined and injected at the EUT input. Both signals were set to be equal at maximum drive level (15dBm at the output). The signals were chosen and spaced so that will potentially produce both in-band and out-of-band 3rd order inter-modulation products.

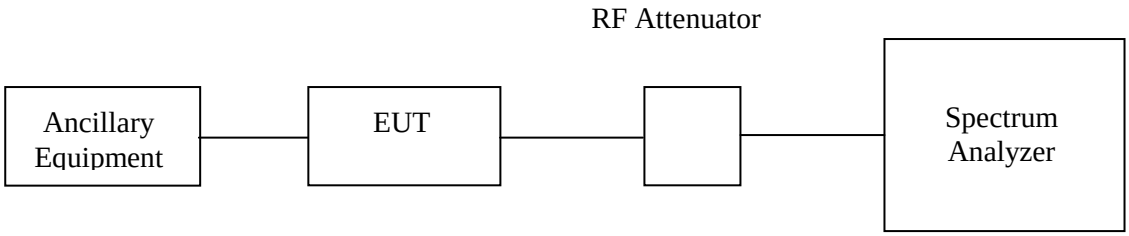
The spectrum analyzer was set to 30 kHz RBW and 300 kHz VBW. One carrier was set at the band edge and the other spaced 200 kHz for GSM and Edge and 1.25MHz for IDMA & 1xEVDO.

	f_1 [MHz]	f_2 [MHz]	Potential 3rd Order IM	
			In-band [MHz]	Out-of-band [MHz]
CDMA	869.7	870.95	868.45	872.2
CDMA	893.3	892.05	894.55	890.8
GSM & EDGE	869.2	869.4	869	869.6
GSM & EDGE	893.8	893.6	894	893.4

2.4. Occupied BW Measurements:

The transmitter output was connected to the input of the Spectrum analyzer through an attenuator.
The ancillary equipment was configured to generate continuous signals with PRBS data modulation, and the output power of the EUT was adjusted to be 15dBm. The modulated spectrum of the output was measured and compared to the input modulated spectrum.

The RBW was set to be at least 1% of the Emission BW. Peak detector was used to capture the emission. The Occupied BW between -26dBc points and also the 99% power BW were measured using the built in Occupied BW Measurements function.



2.5. Frequency stability measurements:

2.5.1 Frequency Stability with Voltage Variation:

The EUT **was** placed in an environmental chamber and allowed to stabilize at +20°C for at least 15 minutes. The spectrum analyzer and signal generator is phase locked with the same 10 MHz reference frequency by connecting the 10 MHz ref. With the voltage input to the EUT set to 85% of nominal voltage, the transmitter carrier output frequency was measured in 1 minute intervals for a period of 5 minutes. This procedure was repeated at 115% of nominal voltage.

2.5.2 Frequency Stability with Temperature Variation:

The input voltage to the EUT was set to nominal voltage and the temperature of the environmental chamber was varied in 10 degree steps through the range -20°C to +50°C. The transmitter carrier output frequency was measured within 1 minute after powering up, at intervals of 1 minute thereafter, until 10 minutes have elapsed (or until sufficient measurements is obtained to indicate clearly that the frequency has stabilized, whichever time period is greater).

3. Test Facility & Uncertainty of Measurement

3.1. Accreditation/ Registration reference:

- *A2LA Certificate Number: 1633.01*

3.2. Test Facility description

The tests were performed at the EMC Laboratory, QualiTech Division, ECI Telecom Group

Address: 30, Hasivim St., Petah Tikva, Israel.
Tel: 972-3-926-8443

3m Anechoic Chamber:

The 3m-screened chamber is used in two configurations: the semi-anechoic configuration for Radiated Emission measurements and the full-anechoic configuration for Radiated Immunity tests.

Semi Anechoic Configuration:

Measurement distance	3m
Chamber dimensions	9.5m x 6.5m x 5.2m
Antenna height	1 - 4m
Shielding Effectiveness	Magnetic field ≥80dB at 15 kHz ≥90dB at 100 kHz Electric field >120dB from 1MHz to 1GHz >110dB from 1GHz to 10GHz
Absorbing material	Ferrite tiles on the walls and ceiling Frankonia hybrid absorbing material in selected positions on the walls
Normalized Site Attenuation measured at 5 positions	±3.49dB, 30MHz to 1GHz
Transmission Loss measured at 5 positions, at 1.5m height	±3dB, 1GHz to 18GHz

Full-Anechoic Configuration:

Measurement distance	3m
Chamber dimensions	7m x 4m x 3m
Antenna height	1.55m at Horizontal & Vertical polarizations
Shielding Effectiveness	Magnetic field ≥80dB at 15 kHz ≥90dB at 100 kHz Electric field >120dB from 1MHz to 1GHz >110dB from 1GHz to 10GHz
Absorbing material	Ferrite tiles on the walls and ceiling Frankonia hybrid absorbing material in selected positions on the walls and floor
Field Uniformity to EN61000-4-3	±3dB 80MHz to 18GHz

4. FCC 47 CFR, Part 22: Report of Measurements and examinations

4.1. RF Power Output, Conducted Measurements

Reference document:	**47 CFR §22.913 (a) (2) & §2.1046**		
Test Requirements:	Mobile stations are limited to 7 watts ERP peak power		
Test setup:	See sec 2.1	**Pass**	
Method of testing:	Conducted		
Operating conditions:	Under normal test conditions		
Environment conditions:	Ambient Temperature: 22°c	Relative Humidity: 48%	Atmospheric Pressure: 1011.4 hPa
Test Result:	See below	-	

Test result:

The output power was adjusted to be 15dBm as this is the maximum expected output power for all frequencies and modulations including system tolerances.

EIRP Peak Power [dBm] = Measured [dBm] - Cable Loss [dB] + Substitution Antenna Gain [dBi]
ERP can be calculated from EIRP by subtracting 2.1dBi.
Prediction for part 22 (max antenna gain for mobile operations)
Highest admissible antenna gain for 850 MHz mobile operation (@20cm) where no routine evaluation is required according § 2.1091(c) for P=1.5W ERP
G=10log1500mW[ERP]-15dBm +2.14 dB=18.900 dBi
In order to meet OET Bulletin 65 requirements the highest admissible antenna gain for 850 MHz band is 17 dBi.

4.2. Frequency stability

Reference document:	**47 CFR §22.355 & §2.1055**		
Test Requirements:	The frequency stability shall be less than 2.5 ppm		
Test setup:	See Sec. 2.5	**Pass**	
Method of testing:	Conducted		
Operating conditions:	Under normal test conditions		
Environment conditions:	Ambient Temperature: 22°c	Relative Humidity: 48%	Atmospheric Pressure: 1011.4 hPa
Test Result:	See below	-	

Test results

Frequency error vs. Voltage

Voltage [VAC]	Frequency Error [Hz]	Frequency Error [%]	Frequency Error [ppm]	Limit [ppm]	Test Result
Carrier frequency at 22°C (115 VAC):880 MHz

4.3. Occupied Bandwidth

Reference document:	**47 CFR §22.917 & §2.1049**		
Test Requirements:	The occupied bandwidth that is the frequency bandwidth outside of which all emission are attenuated at least 26 dB below the transmitter power.		
Test setup:	See sec 2.4	**Pass**	
Method of testing:	Conducted		
Operating conditions:	Under normal test conditions		
S.A. Settings:	RBW: 3kHz/30kHz, VBW: 3kHz/300kHz		
Environment conditions:	Ambient Temperature: 22°c	Relative Humidity: 48%	Atmospheric Pressure: 1011.4 hPa

4.6. Block Edge Emissions and Inter-Modulation, Conducted Measurements

Reference document:	**§22.917(b)**		
Test Requirements:	The power of any emission outside of the authorized operating frequency ranges must be attenuated below the transmitting power (P) by a factor of at least 43+10log (P) dB. In the 1MHz bands immediately outside and adjacent to the frequency block a resolution bandwidth of at least 1% of the EBW may be employed.		
Test setup:	See sec 2.3	**Pass**	
Method of testing:	Conducted		
Operating conditions:	Under normal test conditions		
S.A. Settings:	RBW: 30kHz, VBW**:** 300kHz		
Environment conditions:	Ambient Temperature: 22°c	Relative Humidity: 48%	Atmospheric Pressure: 1011.4 hPa
Test Result:	See below	See Plot 4.6.1 -Plot 4.6.16	

Test results:

Modulation: CDMA 2000

Frequency [MHz]	Emission Level* [dBm]	Limit [dBm]	Reference	Actual Attenuation [dBc]	Margin [dB]	Result
869.700 & 870.950	15.0	Carrier				
869	-29.17	-13	5.6.2	44.17	-16.17	Pass
All Other Spurious at least 20 dB blow the limit						Pass
893.300 & 892.050	15.0	Carrier				
894	-24.26	-13	5.6.4	39.26	-11.26	Pass
All Spurious at least 20 dB blow the limit						Pass

***** Spurious Emission [dBm] = Measured [dBm] – Attenuations [dB]

Modulation: CDMA 2000 1xEVDO

Frequency [MHz]	Emission Level* [dBm]	Limit [dBm]	Reference	Actual Attenuation [dBc]	Margin [dB]	Result
869.700 & 870.950	15.0	Carrier				
869	-29.20	-13	5.6.6	44.2	-16.2	Pass
All Other Spurious at least 10 dB blow the limit						Pass
893.300 & 892.050	15.0	Carrier				
894	-24.41	-13	5.6.8	39.41	-11.41	Pass
All Spurious at least 20 dB blow the limit						Pass

***** Spurious Emission [dBm] = Measured [dBm] – Attenuations [dB]

Modulation: GSM –GMSK

Frequency [MHz]	Emission Level* [dBm]	Limit [dBm]	Reference	Actual Attenuation [dBc]	Margin [dB]	Result
869.200 & 869.400	15.0	Carrier				
869	-24..46	-13	5.6.10	39.46	-11.46	Pass
All Other Spurious at least 10 dB blow the limit						Pass
893.800 & 893.600	15.0	Carrier				
894	-23.73	-13	5.6.12	38.73	-10.73	Pass
All Spurious at least 20 dB blow the limit						Pass

***** Spurious Emission [dBm] = Measured [dBm] – Attenuations [dB]

Modulation: EDGE – 8PSK

Frequency [MHz]	Emission Level* [dBm]	Limit [dBm]	Reference	Actual Attenuation [dBc]	Margin [dB]	Result
869.200 & 869.400	15.0	Carrier				
869	-24.46	-13	5.6.14	39.7	-11.7	Pass
All Other Spurious at least 20 dB blow the limit						Pass
893.800 & 893.600	15.0	Carrier				
894	-19.53	-13	5.6.16	34.53	-6.53	Pass
All Spurious at least 20 dB blow the limit						Pass

Appendix E: Accreditation Certificate

The American Association for Laboratory Accreditation

World Class Accreditation

Accredited Laboratory

A2LA has accredited

QUALITECH (ECI TELECOM)

Petach-Tikva, ISRAEL

for technical competence in the field of

Electrical Testing

This laboratory is accredited in accordance with the recognized International Standard ISO/IEC 17025:2005 *General Requirements for the Competence of Testing and Calibration Laboratories*. This accreditation demonstrates technical competence for a defined scope and the operation of a laboratory quality management system (*refer to joint ISO-ILAC-IAF Communiqué dated 8 January 2009*).

Presented this 22nd day of March 2011.

President & CEO
For the Accreditation Council
Certificate Number 1633.01
Valid to September 30, 2012

For the tests or types of tests to which this accreditation applies, please refer to the laboratory's Electrical Scope of Accreditation.
