Field Calibration and Tune-Up Procedure
FCC ID: LLB14280A

Aclara Technologies LLC, Formerly Hexagram's low power RF devices have passed through extensive testing and calibration Procedures while in the factory.

We test the LLB14280A units in production at the customer operating frequency of 467.825MHz and measure the RF power at 18.0 dBm with +/- 1.0 dB tolerance by converting RSSI value from DCU. The transmit power level is fixed and is set using a software setting in the Transceiver. The Hexagram's low power RF devices are shipped to the customer in the sealed enclosures. Therefore, no additional calibration, tuning is required in the field.

Thus, no adjustments or tuning can be made in the field, without breaking the factory sealed enclosure.

Sincerely,

Larry Murphy
Executive Director of Engineering
