 EUT Photographs

- ANNEX C-TISSUE SIMULANT DATA SHEETSANNEX D-SAR VALIDATION RESULTSANNEX E-MEASUREMENT UNCERTAINTY
- ANNEX F SAR PROBE CALIBRATION CERTIFICATES ANNEX G - REFERENCES

The product was tested in accordance with the following standards.

#### **Test Results Summary**

Test Standards	Description	Pass / Fail
<ul> <li>Supplement C (Edition 01-01) to FCC OET Bulletin 65 (Edition 97-01)</li> <li>ANSI/IEEE Standard C95.1-1993</li> </ul>	SAR Measurement (Wireless) Device at head phantom	Pass *

Note:

- 1. The worst-case SAR value was found to be **0.136W/kg** which is lower than the maximum limit of 1.60 W/kg, over 1g of tissue.
- \* Based on spatial peak uncontrolled exposure / general population level: Head: 1.60 W/kg, over 1g of tissue.

Modifications

No modifications were made.

# **PSBCorporation**

#### DEVICE DESCRIPTION

DEVICE DESCRIPTION	
Description	The Equipment Under Test (EUT) is a <b>2.4GHz Wireless Headphone</b> .
Device Category	Portable Device
Exposure Environment	General Population/Uncontrolled exposure
Test Device Type	Production Unit
Model	NTED-800
Brand Name	Nasaco
Serial Numbers	Nil
FCC ID	LLP-NTED800

#### **DEVICE OPERATING CONFIGURATION**

Operating Frequencies	Wireless Mode
	Channel 1 (2402MHz)
	Channel 39 (2441MHz)
	Channel 78 (2480MHz)
Operating Temperature Tolerance	-20 to +50 Degree Celsius
Operating Voltage Tolerance	3 to 4.5 Volt DC
Continuous Transmission	The EUT is able to transmit for about 120 minutes at the maximum
Tolerance	power under fully battery charged condition.
Rated Output Power	15dBm ± 5dBm Maximum
Antenna Type	SMD Chip Antenna
EUT Crest Factor	1.0
Input Power	Rechargeable Ni MH Battery, AAA size, 1.2V DC 800mAh (Qty 3)
Accessories	Charger

#### MANUFACTURER

Manufacturer Address	Nasaco Electronics (HK) Ltd RM 1106, Eastern Centre, 1065 King's Road Hong Kong
DID	(852) 2563 0592
Fax	(852) 2565 9613

#### **DEVICE OPERATING CONDITION**

#### **DEVICE OPERATING CONDITION**

The EUT was exercised by operating at the following frequencies 2.402GHz, 2.441GHz and 2.48GHz. For every SAR measurement, the EUT was set to maximum output power level using fully charged battery.

#### **TEMPERATURE AND HUMIDITY**

Wireless Mode (Head)	
Ambient Temperature:	$24 \pm 1^{0} \mathrm{C}$
Tissue Temperature:	$24 \pm 1^0 \mathrm{C}$
Humidity:	54% to 59%

The measurement results were obtained with the EUT tested in the conditions described in this report (Annex A).

Phantom	Device Test	Antenna		(W/kg), over 1g T Test Channel & Fr	
Configuration	Positions	Position	Channel: 1 2402MHz	Channel: 39 2441MHz	Channel: 78 2480MHz
Left Side of	Cheek / Touch	fixed	0.136	0.118	0.090
Right Side of	Cheek / Touch	fixed	0.075	0.072	0.085
Output Power (dBm) Before Test		19.1	19.6	18.8	
Output Power (dBm) After Test		18.6	18.8	18.4	

Table 1 - SAR Test Results (Wireless) – Device at head phantom

Remarks:

- 1. All modes of operations were investigated and the worst-case SAR levels are reported.
- 2. Three fully charged Ni MH Batteries, AAA size, 1.2V DC 800mAh were used during operation.
- 3. For **Wireless mode**, the worst-case SAR value was found to be **0.136W/Kg** (over a 1g tissue) at **Channel 1** which is lower than the maximum limit of 1.60 W/Kg, please refer to the above table.
- 4. The SAR limit of 1.60W/Kg (Spatial Peak level for Uncontrolled Exposure / General Population) is based on the Test Standards:
  - a) Supplement C (Edition 01-01) to FCC OET Bulletin 65 (Edition 97-01)
  - b) ANSI/IEEE Standard C95.1-1993

Ambient Temperature:	$24 \pm 1^{\circ}$ C
Tissue Temperature:	$24 \pm 1^{0} C$

#### This Report is issued under the following conditions:

- 1. Results of the testing/calibration in the form of a report will be issued immediately after the service has been completed or terminated.
- 2. Unless otherwise requested, a report shall contain only technical results. Analysis and interpretation of the results and professional opinion and recommendations expressed thereupon, if required, shall be clearly indicated and additional fee paid for, by the Client.
- 3. This report applies to the sample of the specific product/equipment given at the time of its testing/calibration. The results are not used to indicate or imply that they are applicable to other similar items. In addition, such results must not be used to indicate or imply that PSB Corporation approves, recommends or endorses the manufacturer, supplier or user of such product/equipment, or that PSB Corporation in any way "guarantees" the later performance of the product/equipment.
- 4. The sample/s mentioned in this report is/are submitted/supplied/manufactured by the Client. PSB Corporation therefore assumes no responsibility for the accuracy of information on the brand name, model number, origin of manufacture, consignment or any information supplied.
- Additional copies of the report are available to the Client at an additional fee. No third party can obtain a copy of this report through PSB Corporation, unless the Client has authorised PSB Corporation in writing to do so.
- 6. PSB Corporation may at its sole discretion add to or amend the conditions of the report at the time of issue of the report and such report and such additions or amendments shall be binding on the Client.
- 7. All copyright in the report shall remain with PSB Corporation and the Client shall, upon payment of PSB Corporation's fees for the carrying out of the tests/calibrations, be granted a license to use or publish the report to the third parties subject to the terms and conditions herein, provided always that PSB Corporation may at its absolute discretion be entitled to impose such conditions on the license as it sees fit.
- 8. Nothing in this report shall be interpreted to mean that PSB Corporation has verified or ascertained any endorsement or marks from any other testing authority or bodies that may be found on that sample.
- 9. This report shall not be reproduced wholly or in parts and no reference shall be made by the Client to PSB Corporation or to the report or results furnished by PSB Corporation in any advertisements or sales promotion.
- 10. Unless otherwise stated, the tests are carried out in PSB Corporation Pte Ltd, No.1 Science Park Drive Singapore 118221

## **TEST INSTRUMENTATION & GENERAL PROCEDURES**

ANNEX A

# ANNEX A

# TEST INSTRUMENTATION & GENERAL PROCEDURE

#### **TEST INSTRUMENTATION & GENERAL PROCEDURES**

#### ANNEX A

#### A.1 General Test Procedure

In the SAR measurement, the positioning of the probes must be performed with sufficient accuracy to obtain repeatable measurements in the presence of rapid spatial attenuation phenomena. The accurate positioning of the E-field probe is accomplished by using a high precision robot. The robot can be taught to position the probe sensor following a specific pattern of points. In a first sweep, the sensor is positioned as close as possible to the interface, with the sensor enclosure touching the inside of the fiberglass shell. The SAR is measured on a grid of points, which covers the curved surface of the phantom in an area larger than the size of the EUT. After the initial scan, a high- resolution grid is used to locate the absolute maximum measured energy point. At this location, attenuation versus depth scan will be accomplished by the measurement system to calculate the SAR value.

#### A.2 SAR Test Instrumentation

#### SAR Measurement System

#### • Positioning Equipment

Type:	High Precision Industrial Robot, RX90.
Precision:	High precision (repeatability 0.02mm)
Reliability:	High reliability (industrial design)

#### Compaq Computer

Туре:	2.4GHz Pentium
Memory:	512MB SDRAM
Operating System:	Windows 2000
Dell Monitor:	17" LCD

#### • Dosimetric E-Field Probe

Type:ET3DV6Isotropy Error ( $\varnothing$ ): $\pm 0.25$ dBDynamic Range:0.01 - 100 W/kg

#### • Phantom & Tissue

	-
Phantom:	"Phantom SAM 12" and "450MHz Phantom" were manufactured by SPEAG.
Tissue:	Simulated Tissue with electrical characteristics similar to those of the
	human at normal body temperature (23 $\pm$ 1°C)
Shell:	Fiberglass shell phantom with 2mm thickness for "Phantom SAM 12".
	Fiberglass shell phantom with 2mm or 6mm thickness for "450MHz Flat
	Phantom".

# **PSBCorporation**

#### **TEST INSTRUMENTATION & GENERAL PROCEDURES**

#### ANNEX A

#### A.3 Test Setup

#### Phantom 197

The "Phantom SAM 12", manufactured by SPEAG is a fiberglass shell phantom with 2 mm shell thickness. It has three measurement areas:

- Left hand
- Right hand
- Flat phantom

The "450MHz Flat Phantom", manufactured by SPEAG is a fiberglass shell phantom with 2mm or 6mm shell thickness. It has one measurement areas:

- Flat phantom
- 1) The "Phantom SAM 12" table comes in the sizes: A 100x50x85 cm (LxWxH).
- 2) The "450MHz Flat Phantom 6mm Shell Thickness" table comes in the sizes: A 82x44x18 cm (LxWxH) is used for System Validation Test.
- 3) The "450MHz Flat Phantom 2mm Shell Thickness" table comes in the sizes: A 82x44x18 cm (LxWxH) is used for SAR Measurement.

The bottom plate contains three pair of bolts for locking the device holder. The device holder positions are adjusted to the standard measurement positions in the three sections. Only one device holder is necessary if two phantoms are used (e.g., for different solutions).

#### Simulated tissue

# Simulated Tissue: Suggested in a paper by George Hartsgrove and colleagues in University of Ottawa Ref.: Bioelectromagnetics 8:29-36 (1987)

This simulated tissue is mainly composed of water, sugar and salt. At higher frequencies, in order to achieve the proper conductivity, the solution does not contain salt. Also, at these frequencies, D.I. water and alcohol is preferred. Tissue Density : Approximately 1.25 g/cm<sup>3</sup>

• Preparation

The ingredients (i.e. water, sugar, salt, etc) required to prepare the simulated tissue are carefully weighed and poured into a clean container for mixing. A stirring paddle, that is attached to a hand drill is used to stir the solution for a duration of about 30 minutes or more. When the ingredients are completely dissolved, the solution is left in the container for the air bubbles to disappear.

#### • Measurement of Electrical Characteristics of Simulated Tissue

- 1) S-PARAMETER Network Analyzer, Agilent 8753ES (30kHz 6GHz)
- 2) Agilent 85070D Dielectric Probe Kit

# **PSBCorporation**

## TEST INSTRUMENTATION & GENERAL PROCEDURES

ANNEX A

# ELECTRICAL CHARACTERISTIC MEASUREMENT SETUP

#### • Description of the Agilent 85070D Dielectric Probe Kit

The 85070D is a dielectric probe that is used to measure the intrinsic electrical properties of materials in the RF and microwave frequency bands. The 85070D software allows you to measure the complex dielectric constant (also called permittivity) of liquids and semisolids, incuding the dielectric loss factor of loss tangent.

To obtain data at hundreds of frequencies in seconds, simply immerse the probe into liquids or semi-solids - no special fixtures or containers are required. The 85070D must be used in conjunction with an Agilent network analyzer. The network analyzer provides the high frequency stimulus, and measures the reflected response.

The probe transmits a signal into the material under test (MUT). The measured reflected response from the materials is then related to its dielectric properties. A computer controls the system, and runs software that guides the user through a measurement sequence. An effort is made to keep the results dielectric constant and conductivity within 5 % of published data.

## **TEST INSTRUMENTATION & GENERAL PROCEDURES**

## ANNEX A

**PSBCorporation** 

#### Tissue Depth

The tissue depth at the "Phantom SAM 12", "450MHz Flat Phantom – 6mm Shell Thickness" and "450MHz Flat Phantom – 2mm Shell Thickness" is approximately 15cm ±0.5cm.

At "Phantom SAM 12"

Tissue – 15.0cm Depth

At "450MHz Flat Phantom – 6mm Shell Thickness"

At "450MHz Flat Phantom – 2mm Shell Thickness"

Tissue – 15.2cm Depth

#### **TEST INSTRUMENTATION & GENERAL PROCEDURES**

#### Positioning of EUT

**The DASY4 holder** is designed to cope with different positions given in the standard. It has two scales for the device rotation (with respect to the body axis) and the device inclination (with respect to the line between the ear openings). The plane between the ear openings and the mouth tip has a rotation angle of 65°. The intended use position in the CENELEC document is has a rotation angle of 65° and an inclination angle of 80°. The rotation centers for both scales is the ear opening. Thus the device needs no repositioning when changing the angles. The device rotation around the device axis is not changed in the holder. In the CENELEC standard it is always 0°. If the standard changes, a support will be provided with the new angle.

- "Cheek/Touch Position" the device is brought toward the mouth of the head phantom by pivoting against the "ear reference point" or along the "N-F" line for the SCC-34/SC-2 head phantom. This test position is established:
- i) When any point on the display, keypad or mouthpiece portions of the handset is in contact with the phantom.
- ii) (Or) When any portion of a foldout, sliding or similar keypad cover opened to its intended selfadjusting normal use position is in contact with the cheek or mouth of the phantom.

For existing head phantoms – when the handset loses contact with the phantom at the pivotingpoint, rotation should continue until the device touches the cheek of the phantom or breaks its last contact from the ear spacer.

- 2. "Ear/Tilt Position" With the handset aligned in the "Cheek/Touch Position":
- i) If the earpiece of the handset is not in full contact with the phantom's ear spacer (in the "Cheek/Touch position") and the peak SAR location for the "Cheek/Touch" position is located at the ear spacer region or corresponds to the earpiece region of the handset, the device should be returned to the "initial ear position" by rotating it away from the mouth until the earpiece is in full contact with the ear spacer.
- ii) (Otherwise) The handset should be moved (translated) away from the cheek perpendicular to the line passes through both "ear reference points" (note: one of these ear reference points may not physically exist on a split head model) for approximate 2-3 cm. While it is in this position, the handset is tilted away from the mouth with respect to the "test device reference point" by 15°. After the tilt, it is then moved (translated) back toward the head perpendicular to the line passes through both "ear reference points" until the device touches the phantom or the ear spacer. If the antenna touches the head first, the positioning process should be repeated with a tilt angle less than 15° so that the device and its antenna would touch the phantom simultaneously. This test position may require a device holder or positioner to achieve the translation and tilting with acceptable positioning repeatability.

#### 3. **Body Worn Configuration**

All body worn accessories are tested for the FCC RF exposure compliance. The phone is positioned into carrying case (if available) and placed below of the flat phantom. Headset or ear piece (if available) is connected during measurements.

# TISSUE SIMULANT DATA SHEETS

Type of Tissue	Head
Target Frequency (MHz)	2450
Target Dielectric Constant	39.2
Target Conductivity (S/m)	1.8
Composition (by weight)	Water 20000g (56.69%)
	Glycol 15278g (43.31%)
	Sugar (0%)
	Salt (0%)
	HEC (0%)
	Preventol D7 (0%)
Measured Dielectric Constant	38.84
Measured Conductivity (S/m)	1.8736

Probe Name	Dosimetric E-field Probe	
	EX3DV4	
Probe Serial Number	3541	
Sensor Offset (mm)	1.2	
Conversion Factor	7.54 ± 11.8 %	
Probe Calibration Due Date (DD/MM/YY)	18 July 2006

#### Calibration Laboratory of S Schweizerischer Kalibrierdienst SWISS C Service suisse d'étalonnage Schmid & Partner Servizio svizzero di taratura Engineering AG S Swiss Calibration Service Zeughausstrasse 43, 8004 Zurich, Switzerland BRA Accreditation No.: SCS 108 Accredited by the Swiss Federal Office of Metrology and Accreditation The Swiss Accreditation Service is one of the signatories to the EA Multilateral Agreement for the recognition of calibration certificates Glossary: TSL tissue simulating liquid NORMx,y,z sensitivity in free space ConF sensitivity in TSL / NORMx,y,z DCP diode compression point Polarization φ φ rotation around probe axis Polarization 9 9 rotation around an axis that is in the plane normal to probe axis (at measurement center), i.e., $\vartheta = 0$ is normal to probe axis Calibration is Performed According to the Following Standards: a) IEEE Std 1528-2003, "IEEE Recommended Practice for Determining the Peak Spatial-Averaged Specific Absorption Rate (SAR) in the Human Head from Wireless Communications Devices: Measurement Techniques", December 2003 b) CENELEC EN 50361, "Basic standard for the measurement of Specific Absorption Rate related to human exposure to electromagnetic fields from mobile phones (300 MHz - 3 GHz), July 2001 Methods Applied and Interpretation of Parameters: NORMx,y,z: Assessed for E-field polarization 9 = 0 (f ≤ 900 MHz in TEM-cell; f > 1800 MHz: R22 waveguide). NORMx,y,z are only intermediate values, i.e., the uncertainties of NORMx,y,z does not effect the E<sup>2</sup>-field uncertainty inside TSL (see below ConvF). NORM(f)x,y,z = NORMx,y,z \* frequency\_response (see Frequency Response Chart). This linearization is implemented in DASY4 software versions later than 4.2. The uncertainty of the frequency response is included in the stated uncertainty of ConvF. DCPx, v, z; DCP are numerical linearization parameters assessed based on the data of power sweep (no uncertainty required). DCP does not depend on frequency nor media. ConvF and Boundary Effect Parameters: Assessed in flat phantom using E-field (or Temperature Transfer Standard for f ≤ 800 MHz) and inside waveguide using analytical field distributions based on power measurements for f > 800 MHz. The same setups are used for assessment of the parameters applied for boundary compensation (alpha, depth) of which typical uncertainty values are given. These parameters are used in DASY4 software to improve probe accuracy close to the boundary. The sensitivity in TSL corresponds to NORMx,y,z \* ConvF whereby the uncertainty corresponds to that given for ConvF. A frequency dependent ConvF is used in DASY version 4.4 and higher which allows extending the validity from ± 50 MHz to ± 100 MHz. Spherical isotropy (3D deviation from isotropy): in a field of low gradients realized using a flat phantom exposed by a patch antenna. Sensor Offset: The sensor offset corresponds to the offset of virtual measurement center from the probe tip (on probe axis). No tolerance required. Certificate No: EX3-3541\_Jul05 Page 2 of 10
