## 1. MAXIMUM PERMISSABLE EXPOSURE

## Calculations for Maximum Permissible Exposure Levels

Power Density $=\operatorname{Pd}\left(\mathrm{mW} / \mathrm{cm}^{2}\right)=\operatorname{EIRP} /\left(4^{*} \pi^{*} \mathrm{~d}^{2}\right)$
EIRP $=P^{*} G$
$\mathrm{P}=$ Peak output power (mW)
$\mathrm{G}=$ Antenna numeric gain (numeric)
$d=$ Separation distance (cm)
Numeric Gain $=10^{\wedge}(\mathrm{G}(\mathrm{dBi}) / 10)$
The calculations in the table below use the highest conducted power values together with the lowest antenna gain specified for the EUT. These calculations represent worst case in terms of the exposure levels.
