## REVISION HISTORY

Date	Revision	Comments
06/06/06	O	Original release

## 1.0 Product and System Description

FCC ID: LO6-DVRS800 is a MOBEXCOM Digital Vehicular Repeater (DVR) manufactured by FUTURECOM Systems Group. The DVR, in addition to standalone operation, is capable of interfacing to a companion mobile radio using serial data protocol for audio and control. The full duplex DVR provides local area coverage for portable to portable communication in the 806-825 and 851-870MHz band while the companion mobile radio provides wide-area coverage extension.

The system can operate in the following modes: Mobile mode - where the vehicular repeat function is off but receives emergency and mode change commands from portable devices; Local mode - with portable to portable repeat and network monitoring capabilities; and System mode - with portable to portable repeat functions with full network interconnect. Furthermore, the DVRS offers a busy lockout feature where a simulcast prevention algorithm is used for seamless multi-vehicle operation on the same channel. Moreover, the system supports emergency calls in the MDC1200 signaling format. Other system features include field programmability, seamless interface to a mobile radio through the control head bus, controllability via a mobile radio control head, as well as remotely by a dispatcher or portable user. The DVR supports up to 64 channels and 255 talk groups, MDC1200, DTMF, EIA, CCIR signaling as well as PL and DPL. The DVR supports programmability of leading and/or trailing tones, and audio and TX priorities per mode as well as talk group steering.

This test report covers the RF Exposure performance of the 800MHz 10 watts DVR interfaced with, and transmitting simultaneously with, either companion VHF mobile radios with transmit powers up to 57 watts and with both units, installed in a typical vehicle.

The DVR transmit frequency ranges are 806-825 and 851-870MHz at transmit duty cycle up to 100%. The VHF mobile transmit frequency range is 147-174MHz at transmit duty cycle up to 50%. The DVR antenna is limited to  $\frac{1}{4} \lambda$  (0dBd gain) mounted at the center of the trunk, and the VHF mobile antennas are limited to  $\frac{1}{4} \lambda$  (0dBd gain) mounted at the center of the roof. The maximum conducted power delivered to the DVR antenna is 10 watts.

This device will be marketed to and used by employees solely for work-related operations, such as public safety agencies, e.g. police, fire and emergency medical. User training is the responsibility of these agencies which can be expected to employ the usage instructions, safety information and operational cautions set forth in the user's manual, instructional sessions or other means.

Accordingly this product is classified as Occupational/Controlled Exposure. However, In accordance with FCC requirements, the passengers inside the vehicle and the bystanders external to the vehicle are evaluated to the General Population/Uncontrolled Exposure Limits.

(Note that "By-standers" as used herein mean people other than operator)

## 2.0 Additional Options and Accessories:

NA

## 3.0 Measurement and Limit Standards

Measurements were performed according to the recommended guidelines in IEEE/ANSI C95.3-2002 and compared to FCC Limits Per 47 CFR 2.1091 (d) for General Population/Uncontrolled RF Exposure.

For test frequencies ranging from 806-870MHz the MPE (Maximum Permissible Exposure) limit to electromagnetic energy in equivalent plane wave free-space power density is  $0.54 - 0.58\text{mW/cm}^2$  and calculated using the formula  $f/1500$ . For test frequencies ranging from 146-174MHz the MPE limit is  $0.2\text{mW/cm}^2$

## 4.0 Data Collection Consideration

Power density testing was performed with DUT installed in a 1991 Ford Taurus (4-door). Measurement data was taken with the vehicle running at idle and the vehicle battery measuring 14.0 volts.

## 5.0 Measurement System Uncertainty Levels

The information below presents an estimate of the possible errors that are associated with the measurement system.

Uncertainty Budget for Near Field Probe Measurements

	Tol. ( $\pm \%$ )	Prob. . Dist.	Divisor	$u_i$ ( $\pm \%$ )
<b>Measurement System</b>				
Survey Meter Calibration	3.0	N	1.00	3.0
Repeatability Accuracy	7.0	N	1.00	7.0
<b>Combined Standard Uncertainty</b>		RSS		7.6
<b>Expanded Uncertainty</b>		$k=2$		15

## 6.0 Method of Measurement

MPE measurements were conducted for each transmitter individually per the procedures described in the following sections. Percent of Limit was calculated for each transmitter individually for each position. Final results representing the maximum combined exposure of DVR and each mobile radio were obtained by summing the highest percent of limit results from each transmitter.

**6.1    DVR800 EME measurements made with trunk mounted antenna(s)**

(For reference, see Illustration of antenna location and test distances in APPENDIX A)

**6.1.1    External vehicle EME measurement**

(Antenna mounted at trunk center)

MPE measurements for by-stander conditions are determined by taking the average of (10) measurements in a 2m vertical line for each of the (5) test positions indicated in APPENDIX A with 20cm increments at the test distance of 90cm from the test vehicle's body, as stated in the user manual. The measurement probe sensor is rotated 180° at each of the ten incremental measurements to ensure the highest result is captured. These measurements are representative of persons other than the operator standing next to the vehicle.

The DVR antenna mounted at the center of the trunk was assessed across the TX band for the (5) by-stander conditions presented in APPENDIX A.

**6.1.2    Internal vehicle EME measurement**

(Antenna mounted at trunk center)

While rotating survey meter probe through 180 degrees to ensure that the highest level is found, scans were performed inside of the vehicle, at both front and back seating areas, across the TX band to ascertain the highest level at the head. After the highest level is found, scans were performed vertically making two (2) additional measurements within an area approximately 40cm wide (representing the width of a person) so as to have a total of three (3) measured points, indicated below, that are averaged.

- a) Head area
- b) Chest area
- c) Lower Trunk area

**6.2    Mobile VHF EME measurements made with roof mounted antenna(s)**

(For reference, see Illustration of antenna location and test distances in APPENDIX A).

**6.2.1    External vehicle EME measurement**

(Antenna mounted at roof center)

MPE measurements for by-stander conditions are determined by taking the average of (10) measurements in a 2m vertical line for each of the (5) test positions indicated in APPENDIX A with 20cm increments at the test distance of 90cm from the test vehicle's body, as stated in the user manual. The measurement probe sensor is rotated 180° at each of the ten incremental measurements to ensure the highest result is captured. These measurements are representative of persons other than the operator standing next to the vehicle.

The Mobile VHF antenna mounted at the center of the roof was assessed across the TX band for the (5) by-stander conditions presented in APPENDIX A.

### 6.2.2 Internal vehicle EME measurement (Antenna mounted at roof center)

While rotating survey meter probe through 180 degrees to ensure that the highest level is found, scans were performed inside of the vehicle, both at the front and back seating areas, across the TX band to ascertain the highest level in each location. After the highest level is found, two (2) additional measurements were performed vertically within an area approximately 40cm wide (representing the width of a person) so as to have a total of three (3) measured points as indicated below that are averaged.

- a) Head area
- b) Chest area
- c) Lower Trunk area

## 7.0 Test Site

The test site is the Motorola open area test site located at 8000 W. Sunrise Blvd., Plantation, FL. 33322.

## 8.0 Measurement System/Equipment

Equipment Type	Model #	SN	Calibration Due Date
Automobile	1991 Ford Taurus, 4-Door		
Survey Meter	NARDA Model 8718	01108	5/17/06
Probe - E-Field (Electric Field)	NARDA Model 8722B	13001	2/28/07
*Probe - E-Field (Electric Field)	NARDA Model 8722B	13001	7/21/06
*Probe - H-Field (Magnetic Field)	NARDA Model 8732	06007	6/28/06

\* Equipment probes used during XTL5000 VHF (test dates 10/21/2005 – 11/11/2005)

## 9.0 Test Unit Description

Power density measurements were performed on a representative sample of the DVR with serial number 05091244. The test frequencies were 806, 815, 824, 851, 860 and 869MHz.

Power density measurements were performed on the following representative sample of the Motorola XTL5000 VHF 57 watt mobile radios:

Model #	Serial #	Test Frequencies (MHz)
M20KSS9PW1AN	112	147.0125, 155.0125, 173.9875
M20KTS9PW1AN	VHF P1 EME#46	147.4000, 155.0000, 173.9875

Note Model M20KTS9PW1AN FCC ID AZ492FT3808 maximum power is 120W however the maximum power for use with ¼ wave antennas while interfaced with DQPMDVR8000P is 57W as stated in the DVRS Product Safety and RF Energy Exposure Booklet.

Presented below is a summary of the tested frequencies and associated power outputs for each DUT.

DVR		Mobile VHF Radios			
		M20KSS9PW1AN		M20KTS9PW1AN	
Frequenc y (MHz)	Po (W)	Frequenc y (MHz)	Po (W)	Frequenc y (MHz)	Po (W)
806	10.0	147.0125	55.6	147.4	55.8
815	9.98	155.0125	55.8	155	55.6
824	9.95	173.9875	55.6	173.9875	55.8
851	10.0				
860	9.98				
869	10.0				

## 10.0 Test Set-Up Description

The following are the mobile antenna test configurations used for this product.  
(for reference, see Illustration of antenna location and test distances in the APPENDIX A)

- a) The ¼ wave 0dBd gain antennas (HAD4007A, HAD4008A, HAD4009A) were assessed while mounted at the center of the roof of the test vehicle.
- b) The ¼ wave 0dBd gain antenna (HAF4016A) was assessed while mounted at the trunk.

Assessments were made internal and external to the test vehicle at the specified distances and test locations indicated in sections 6.0, 11.0, and the APPENDIX A.

## 11.0 Test Results Summary

APPENDIX E presents detailed MPE measurement information for each test configuration; person external or internal to the vehicle, TX frequency, antenna (location, model and gain), distance from antenna to probe sensor, E/H field measurements, calibration factor, MPE average over body, initial power, power density calc, power density max calc, IEEE/FCC controlled and uncontrolled limits, and maximum output power.

The Average over Body test methodology is consistent with IEEE/ANSI C95.3-2002 guidelines

MPE results are based on a DVR 100% duty cycle and VHF mobile 50% duty cycle which is in accordance with the User Manual instructions.

Below is an explanation of how the MPE results are calculated.

External to vehicle - 10 measurements are averaged over the body (*Body\_Avg*).

Internal to vehicle - 3 measurements are averaged over the body (*Body\_Avg*).

Narda Survey Meter measures in percent of the controlled limit. Therefore the averages over the body used in the calculations below reflect percentages.

Therefore;

$$\text{Average\_over\_Body} = \text{Body\_Avg} * \text{Controlled\_Limit}$$

$$\text{Pwr\_Density\_Calc} = \text{Average\_over\_Body} * \text{Duty\_Cycle}$$

$$\text{Pwr\_Density\_Max\_Calc} = \text{Pwr\_Density\_Calc} * \frac{\text{Max\_Output\_Power}}{\text{Initial\_Output\_Power}}$$

Note; For *Initial Output Power*>*Max\_Output\_Power*, *Max\_Output\_Power* / *Initial Output Power* = 1

**The tables below summarize the highest MPE results of the E and H test configurations for the VHF mobiles, DVR, and combined assessments. See APPENDICES A and E respectively for the indicated test positions and detailed MPE measurement data.**

**Table 1 - M20KSS9PW1AN VHF Mobile Assessments – Highest MPE result per test position**

## 12.0 Conclusion

Because the signals emitted by each individual transmitter are statistically uncorrelated, the collective compliance of the transmitters is determined by summing the individual ratios between actual (S) and maximum allowed MPE exposure. Compliance is achieved if the total exposure level (T) is less than one:

Formula:

$$T = \frac{S_1}{MPE_1} + \frac{S_2}{MPE_2} + \dots < 1$$

Depending on the test frequency, both VHF mobile assessments were performed with an output power range of 55.6W – 55.8W. The DVR output power across the TX band is 9.95W – 10.00W. The highest power density results for the XTL5000 VHF mobile devices scaled to the maximum allowable power output is 0.16mW/cm<sup>2</sup> internal to the vehicle and 0.07mW/cm<sup>2</sup> external to the vehicle. The highest power density results for the DVR device scaled to the maximum allowable power output is 0.09mW/cm<sup>2</sup> internal to the vehicle and 0.06mW/cm<sup>2</sup> external to the vehicle. The highest combined power density performance is 96.7% of the FCC/IEEE MPE limits using the methodology and formula below.

Therefore:

Passenger	$T = \frac{0.16}{0.2} + \frac{0.09}{0.54} = 0.967 < 1$	(compliant)
By-stander	$T = \frac{0.07}{0.2} + \frac{0.06}{0.54} = 0.424 < 1$	(compliant)

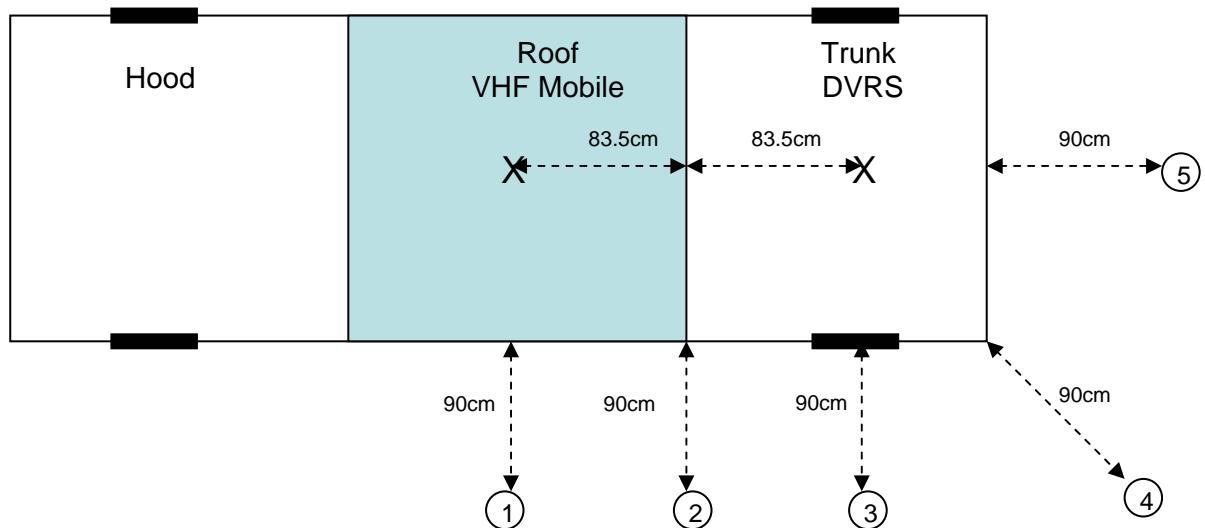

The MPE results presented herein demonstrate compliance to the applicable FCC/IEEE Occupational/Controlled exposure limit of 1.0mW/cm<sup>2</sup> for the frequency range of 30-300MHz and f/300 for the frequency range of 300-1500MHz.

Compliance to the FCC/IEEE General population/Uncontrolled exposure limits of 0.2mW/cm<sup>2</sup> for the frequency range of 30-300MHz and f/1500 for the frequency range of 300-1500MHz is also demonstrated herein for both passengers and by-standers.

## APPENDIX A

### Illustration of Antenna Locations and Test Distances

### MPE By-stander Test Positions

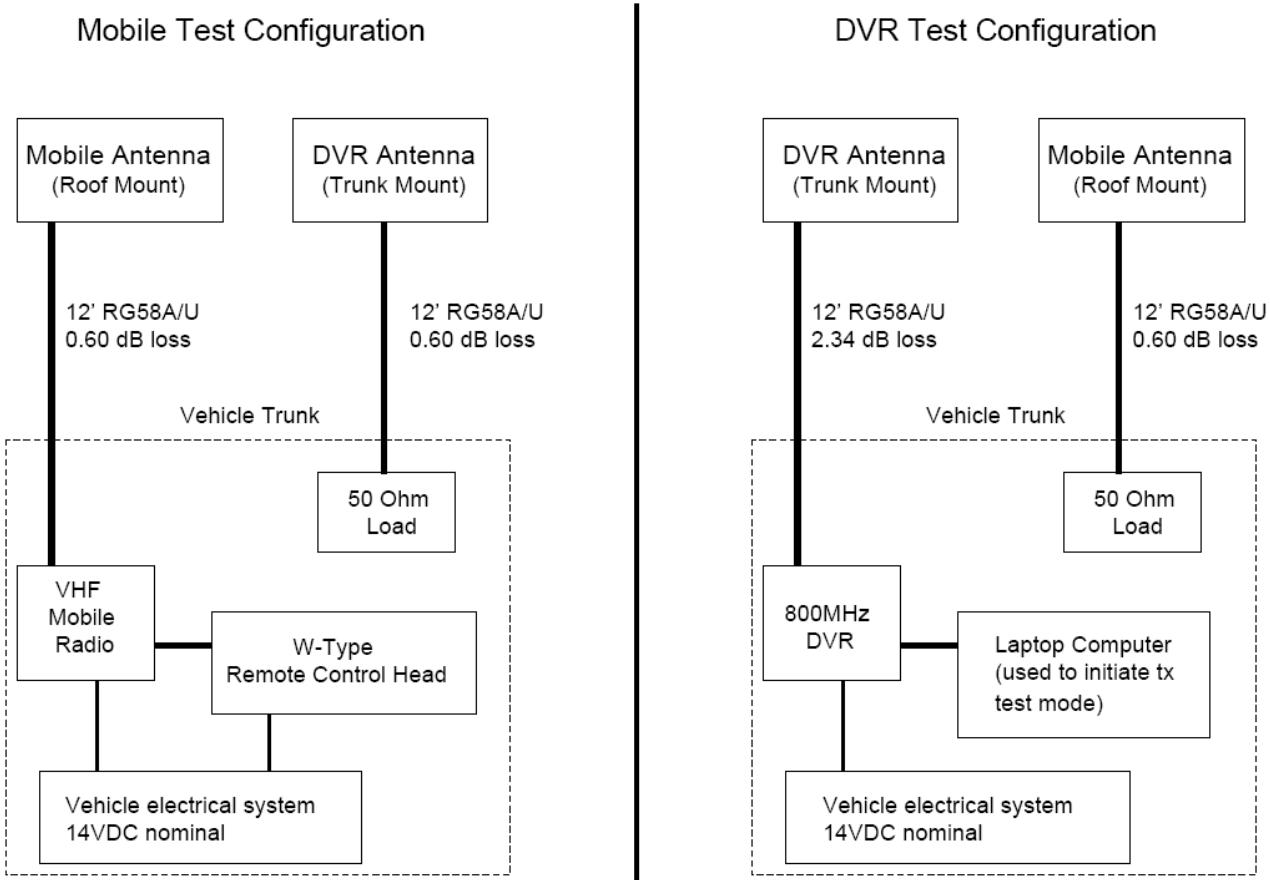

**X** Antenna position  
(centered on roof & trunk)

**○** By-stander (BS) positions for DVR and Companion Mobile (90cm from vehicle body)  
Note:

- 1) Assessments were performed at each test position for each offered antenna.
- 2) Position 2 is located at the mid point between the two antennas which is by 83.5cm.
- 3) Total distance between by-stander position 1 and roof mount antenna is 180cm.
- 4) Total distance between by-stander position 5 and trunk mount antenna is 119.5cm.

# Certificate of Calibration

L-3 Communications, Narda Microwave-East, hereby certifies that the referenced RF Radiation Hazard monitoring equipment has been calibrated in accordance with MIL-STD-45662A, ANSI Z540, ISO 10012 and ISO 9001: 2000.

The measured values were determined by comparison with our standards, which are traceable to the National Institute of Standards and Technology to the extent allowed by NIST's calibration facilities.
