ENGINEERING STATEMENT

The measurements shown in this report were made in accordance with the procedures described on test pages. All reported testing was carried out on a sample equipment to demonstrate limited compliance with FCC 47 CFR Part 95, Subpart M and ISED Canada RSS-251. The sample tested was found to comply with the requirements defined in the applied rules.

EXECUTIVE SUMMARY

A sample of this product was tested and found to be compliant with FCC 47 CFR Part 95, Subpart M (2018), ISED Canada RSS-251 Issue 2 (2018-06).

3 Description of the Equipment Under Test

Equipment characteristics	
Type designation:	2H5TR
Parts of the system:	Radar ECU
Options and accessories:	---
Type of equipment:	Vehicle Radar
Serial number:	---
Manufacturer:	APTIV Services Deutschland GmbH
Hardware version:	1.00
Software version:	1.00
Drawing number:	---
Build status:	---
Power supply:	Battery supply (regulated lead-acid) Nominal: 13.2 V DC Minimum: 9.6 V DC Maximum: 15.2 V DC Nominal frequency: N/A - DC
Highest internal frequency:	--- / 76.9 GHz

Marking Plate(s)

Technical Description

The Equipment Under Test (EUT) was an Aptiv 2H5TR. The EUT operates in the 76 GHz – 77 GHz band. The device employs a dynamic chirp modulated transmit array. Multiple receive antennas are used to determine target angular resolution through digital beam forming. The device is intended to be mounted at the front and rear corners of a vehicle. The EUT's normal operating voltage is DC 13.2 V

Modulation characteristics:

b. Non-pulsed radar

The radar is a FMCW radar.

Modulation Type: Sawtooth

Sweep Bandwidth: 175 MHz / 425 MHz (alternating)

Sweep rate: 7 THz/s / 17 THz/s (alternating)

Sweep time: 29 us / Reset time (no transmission): 0.8 us and 3 us

4 Operation Mode and Configuration of EUT

Operation Mode(s)

The operating modes with single frequency, 175 MHz, 300 MHz and 425 MHz were tested on the lowest, middle and highest frequency configuration, each, as provided by the manufacturer.

List of ports and cables

No.	Description	Classification ¹	Cable type	Cable length	
				used	maximum ²
D1	DC 12 V supply	dc power	Unshielded	2 m	< 3 m
S1	Wiring harness (CAN, Ethernet)	signal/control port	Unshielded	2 m	< 3 m

List of devices connected to EUT

List of support devices

No.	Description	Type designation	Serial no. or ID	Manufacturer
1	CAN/LIN-Interface	VN1640A		Vector
2	Notebook	Latitude 5480	---	Dell

¹ Ports shall be classified as ac power, dc power or signal/control port.

² As specified by applicant

5 Test Setups

Radiated Emission in Fully or Semi Anechoic Room

Radiated emission in fully or semi anechoic room is measured in the frequency range from 30 MHz to the maximum frequency as specified in CFR 47 Part 15 section 15.33.

Measurements are made in both the horizontal and vertical planes of polarization using a spectrum analyzer with the detector function set to peak and resolution as well as video bandwidth set to 100 kHz (below 1 GHz) or 1 MHz (above 1 GHz).

Testing up to 1 GHz is performed with a linear polarized logarithmic periodic antenna combined with a 4:1 broadband dipole ("Trilog broadband antenna"). For testing above 1 GHz horn antennas are used.

All tests below 8.2 GHz are performed at a test distance D of 3 meters. For higher frequencies the test distance may be reduced (e.g. to 1 meter) due to the sensitivity of the measuring instrument(s) and the test results are calculated according to CFR 47 Part 15 section 15.31(f)(1) using an extrapolation factor of 20 dB/decade. If required, preamplifiers are used for the whole frequency range. Special care is taken to avoid overload, using appropriate attenuators and filters, if necessary.

If the radiated emission limits are expressed in terms of the average value of the emission there also is a peak limit corresponding to 20 dB above the maximum permitted average limit. Additionally, if pulsed operation is employed, the average field strength is determined by averaging over one complete pulse train, including blanking intervals, as specified in CFR 47 Part 15 section 15.35(c). If the pulse train exceeds 0.1 second that 0.1 second interval during which the value of the emission is at its maximum is selected for calculation. The pulse train correction is added to the peak value of the emission to get the average value.

Hand-held or body-worn devices are rotated through three orthogonal axes to determine which attitude and configuration produces the highest emission relative to the limit and therefore shall be used for final testing.

During testing the EUT is rotated all around to find the maximum levels of emissions. Equipment and cables are placed and moved within the range of position likely to find their maximum emissions.

For final testing below 1 GHz a semi anechoic room complying with the NSA requirements of ANSI C63.4 for alternative test sites is used (see 0). If prescans are recorded in fully anechoic room they are indicated appropriately.

According to section 13 of KDB558074 the requirement for radiated emissions on the band edges was performed with a reduced bandwidth of 100 kHz instead of 1 MHz.

Radiated emission in the frequency range 9 kHz to 30 MHz is measured using an active loop antenna. First the whole spectrum of emission caused by the equipment is recorded at a distance of 3 meters in a fully or semi anechoic room with the detector of the spectrum analyzer or EMI receiver set to peak. This configuration is also used for recording the spectrum of intentional radiators.

Hand-held or body-worn devices are rotated through three orthogonal axes to determine which attitude and configuration produces the highest emission relative to the limit and therefore shall be used for final testing.

EUT is rotated all around to find the maximum levels of emissions. Equipment and cables are placed and moved within the range of position likely to find their maximum emissions.

If worst case emission of the EUT cannot be recorded with EUT in standard position and loop antenna in vertical polarization the EUT (or the radiating part of the EUT) is rotated by 90 degrees instead of changing the loop antenna to horizontal polarization. This procedure is selected to minimize the influence of the environment (e.g. effects caused by the floor especially with longer distances).

Final measurement is performed at a test distance D of 30 meters using an open field test site. In case the regulation requires testing at other distances, the result is extrapolated by either making measurements at an additional distance D of 10 meters to determine the proper extrapolation factor or by using the square of an inverse linear distance extrapolation factor (40 dB/decade). In cases of very low emissions measurements are performed at shorter distances and results are extrapolated to the required distance. The provisions of CFR 47 Part 15 sections 15.31(d) and (f)(2) apply. According to CFR 47 Part 15 section 15.209(d) final measurement is performed with detector function set to quasi-peak except for the frequency bands 9 to 90 kHz and 110 to 490 kHz where, for non-pulsed operation, average detector is employed.

If the radiated emission limits are expressed in terms of the average value of the emission there also is a peak limit corresponding to 20 dB above the maximum permitted average limit. Additionally, if pulsed operation is employed, the average field strength is determined by averaging over one complete pulse train, including blanking intervals, as specified in CFR 47 Part 15 section 15.35(c). If the pulse train exceeds 0.1 second that 0.1 second interval during which the value of the emission is at its maximum is selected for calculation. The pulse train correction is added to the peak value of the emission to get the average value.

Radiated Emission at Alternative Test Site

Alternate test site (semi anechoic room)

Radiated emission in the frequency range 30 MHz to 1 GHz is measured within a semi-anechoic room with groundplane complying with the NSA requirements of ANSI C63.4 for alternative test sites. A linear polarized logarithmic periodic antenna combined with a 4:1 broadband dipole ("Trilog broadband antenna") is used. The measurement bandwidth of the test receiver is set to 120 kHz with quasi-peak detector selected.

If the radiated emission limits are expressed in terms of the average value of the emission there also is a peak limit corresponding to 20 dB above the maximum permitted average limit. Additionally, if pulsed operation is employed, the average field strength is determined by averaging over one complete pulse train, including blanking intervals, as specified in CFR 47 Part 15 section 15.35(c). If the pulse train exceeds 0.1 second that 0.1 second interval during which the value of the emission is at its maximum is selected for calculation. The pulse train correction is added to the peak value of the emission to get the average value.

Hand-held or body-worn devices are tested in the position producing the highest emission relative to the limit as verified by prescans in fully anechoic room.

If no prescan in a fully anechoic room is used first a peak scan is performed in four positions to get the whole spectrum of emission caused by EUT with the measuring antenna raised and lowered from 1 to 4 m to find table position, antenna height and antenna polarization for the maximum emission levels.

Data reduction is applied to these results to select those levels having less margin than 10 dB to or exceeding the limit using subranges and limited number of maximums. Further maximization is following.

With detector of the test receiver set to quasi-peak final measurements are performed immediately after frequency zoom (for drifting disturbances) and maximum adjustment.

Equipment and cables are placed and moved within the range of position likely to find their maximum emissions.

In cases where prescans in a fully anechoic room are taken (e. g. if EUT is operating for a short time only or battery is discharged quickly) final measurements with quasi-peak detector are performed manually at frequencies indicated by prescan with EUT rotating all around and receiving antenna raising and lowering within 1 meter to 4 meters to find the maximum levels of emission.

Equipment and cables are placed and moved within the range of position likely to find their maximum emissions.

For measuring emissions of intentional radiators and receivers a test distance D of 3 meters is selected. Testing of unintentional radiators is performed at a distance of 10 meters. If limits specified for 3 meters shall be used for measurements performed at 10 meters distance the limits are calculated according to CFR 47 Part 15 section 15.31(d) and (f)(1) using an inverse linear-distance extrapolation factor of 20 dB/decade.

8 Measurement Uncertainty Values

The measurement uncertainty in the laboratory is less than or equal to the maximum measurement uncertainty according to EN 55016-4-2: 2011 + A1 + A2 + AC and CISPR16-4-2: 2011 + A1 + A2 + Cor1 (UCISPR). This normative regulation means that the measured value is also the value to be assessed in relation to the limit value.

For a 95% confidence level, the measurement uncertainties for defined systems are:

Radio Testing			
Test Name	kp	Expanded Uncertainty	Note
Occupied Bandwidth	2.0	±1.14 %	2

Note 1:

The expanded uncertainty reported according to CISPR 16-4-2:2003-11 is based on a standard uncertainty multiplied by a coverage factor of $k_p = 2$, providing a level of confidence of $p = 95.45\%$

Note 2:

The expanded uncertainty reported according to UKAS Lab 34 (Edition 1, 2002-08) is based on a standard uncertainty multiplied by a coverage factor of $k_p = 2$, providing a level of confidence of $p = 95.45\%$

Note 3:

The expanded uncertainty reported according to UKAS Lab 34 (Edition 1, 2002-08) is based on a standard uncertainty multiplied by a coverage factor of $k_p = 2.05$, providing a level of confidence of $p = 95.45\%$

Note 4:

It has been demonstrated that the used test equipment meets the specified requirements in the standard with at least a 95% confidence.

Note 5:

The expanded uncertainty reported according to IEC 61000-4-3 is based on a standard uncertainty multiplied by a coverage factor of $k_p = 2$, providing a level of confidence of $p = 95.45\%$

Note 6:

The expanded uncertainty reported according to IEC 61000-4-6 is based on a standard uncertainty multiplied by a coverage factor of $k_p = 2$, providing a level of confidence of $p = 95.45\%$

Note 7:

The expanded uncertainty reported according to ETSI TR 100 028 V1.4.1 (all parts) is based on a standard uncertainty multiplied by a coverage factor of $k_p = 1.96$, providing a level of confidence of $p = 95.45\%$

Note 8:

The expanded uncertainty reported according to ETSI TR 102 273 V1.2.1 (all parts) is based on a standard uncertainty multiplied by a coverage factor of $k_p = 1.96$, providing a level of confidence of $p = 95.45\%$

10.1 Radiated Power

Date of Test	2021-11-09 and 2021-11-10
Operator	Martin Steindl
Test Site	Semi anechoic room, cabin no. 11

Test Result	
<input checked="" type="checkbox"/>	Passed
<input type="checkbox"/>	Not Passed

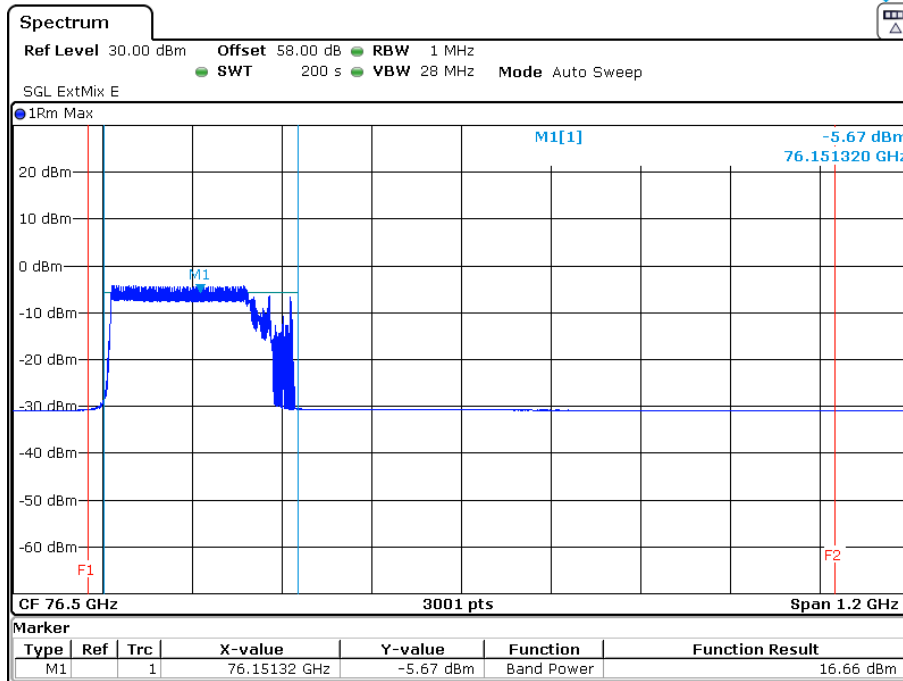

Barometric pressure:	985 hPa
Relative humidity:	37 %
Ambient temperature:	22 °C

Specifications:	Part 95, Subpart M, § 95.3367(a) and (b) RSS-251 Issue 2, Sections 8 and 9
Description:	The fundamental radiated emission limits within the 76 – 81 GHz band are expressed in terms of Equivalent Isotropically Radiated Power (EIRP) and are as follows: a) The maximum power (EIRP) within the 76 – 81 GHz band shall not exceed 50 dBm based on measurements employing a power averaging detector with a 1 MHz Resolution Bandwidth (RBW). b) The maximum peak power (EIRP) within the 76 – 81 GHz band shall not exceed 55 dBm based on measurements employing a peak detector with a 1 MHz RBW.
Operation mode:	Transmitting continuously on frequency with modulation bandwidth as stated in table below
Comment :	Test was performed as radiated test. The test distance was 3 m. A correction factor of -58 dB and mixer conversion loss table were used to account for the test antenna gain, free-space loss and external mixer loss.

Modulation	Detector	Lowest Channel	Middle Channel	Highest Channel	Limit	Note
175 MHz	Average	16.66	17.03	15.83	50 dBm	NA
	Peak	25.57	25.88	25.09	55 dBm	
300 MHz	Average	17.08	17.31	17.15	50 dBm	NA
	Peak	26.05	26.13	26.25	55 dBm	
425 MHz	Average	16.44	16.44	16.40	50 dBm	NA
	Peak	25.58	25.45	25.75	55 dBm

10.2 Occupied Bandwidth

Date of Test	2021-11-09 and 2021-11-10
Operator	Martin Steindl
Test Site	Semi anechoic room, cabin no. 11

Test Result	
<input checked="" type="checkbox"/>	Passed
<input type="checkbox"/>	Not Passed

Barometric pressure:	985 hPa
Relative humidity:	37 %
Ambient temperature:	22 °C

Specifications:	CFR 47, Part 2, Clause 2.1049 and 2.202(a) RSS-GEN Issue 5, Section 6.7 RSS-251, Issue 2, Section 7
Description:	The occupied bandwidth, that is the frequency bandwidth such that, below its lower and above its upper frequency limits, the mean powers radiated are each equal to 0.5 percent of the total mean power radiated by a given emission shall be measured.
Operation mode:	The occupied bandwidth, that is the frequency bandwidth such that, below its lower and above its upper frequency limits, the mean powers radiated are each equal to 0.5 percent of the total mean power radiated by a given emission shall be measured.
Comment :	Transmitting continuously on frequency with modulation bandwidth as stated in table below

Modulation		Lowest Channel	Middle Channel	Highest Channel	Limit	Note
175 MHz	f _L	76.031 GHz	76.411 GHz	76.740 GHz	≥ 76 GHz	NA
	f _H	76.272 GHz	76.653 GHz	76.982 GHz	≤ 77 GHz	
300 MHz	f _L	76.033 GHz	76.348 GHz	76.568 GHz	≥ 76 GHz	NA
	f _H	76.443 GHz	76.760 GHz	76.978 GHz	≤ 77 GHz	
425 MHz	f _L	76.029 GHz	76.284 GHz	76.399 GHz	≥ 76 GHz	NA
	f _H	76.612 GHz	76.865 GHz	76.981 GHz	≤ 77 GHz

10.3 Spurious Radiated Emissions

Date of Test	2021-11-08 to 2021-11-16
Operator	Alex Fink, Martin Steindl
Test Site	Semi anechoic room, cabin no. 11 Fully anechoic room, cabin no. 2

Test Result	
<input checked="" type="checkbox"/>	Passed
<input type="checkbox"/>	Not Passed

Barometric pressure:	983 hPa
Relative humidity:	37 %
Ambient temperature:	22 °C

Specifications:	CFR 47, Part 95, Subpart M, § 95.3379(a) RSS-251 Issue 2, Section 10
Description:	The power density of any emissions outside the 76 – 81 GHz band shall consist solely of spurious emissions and shall not exceed the following: Radiated emissions below 40 GHz shall not exceed the field strength as shown in the Table 1. The power density of radiated of radiated emissions outside the 76 – 81 GHz band above 40 GHz shall not exceed the power density as shown in the tables on the next page.s
Operation mode:	This test was performed as radiated test in the frequency range 30 MHz to 300 GHz. No significant spurious emissions were observed. The test distance was 3 m in the frequency ranges 30 MHz to 1 GHz and 40 GHz to 110 GHz, 1 m in the frequency ranges 1GHz to 40 GHz and 110 GHz to 220 GHz and 0.5 m in the frequency range 220 GHz to 300 GHz.
Comment :	The measurement below was done using EMC 32 V10.40.00 automated software. Based on the antenna power measurement this test was performed with 175 MHz BW on middle frequency and 425 MHz BW on lowest and highest frequency; these modes are considered to cover the worst case scenario. See plots for details.

Sample calculation of field final values:

$$\text{Final Value (dB}\mu\text{V/m)} = \text{Reading Value (dB}\mu\text{V)} + (\text{Antenna Correction Factor (dB/m)} + \text{Cable Correction Factor (dB)})$$

<i>Radiated emission limits 9 kHz – 40 GHz</i>		
<i>Frequency (MHz)</i>	<i>Field strength ($\mu\text{V}/\text{m}$)</i>	<i>Measurement distance (m)</i>
0.009 – 0.490	2400/f(kHz)	300
0.490 – 1.705	24000/f(kHz)	30
1.705 – 30	30	30
30 – 88	100	3
88 – 216	150	3
216 – 960	200	3
960 – 40000	500	3

Note(s):

- 1 In the emissions table the tighter limit applies at the band edges.
- 2 The limits are based on the frequency of the unwanted emissions and not the fundamental frequency. However, the level of any unwanted emission shall not exceed the level of the fundamental frequency.
- 3 The emissions limits shown in the table are based on measurement employing CISPR quasi-peak detector except for the frequency bands 9.0 – 90 kHz, 110.0 – 490 kHz, and above 1 GHz. Radiated emissions limits in these three bands are based on measurements employing an average detector with 1 MHz RBW.

Table 1: Radiated emission limits 9 kHz – 40 GHz

<i>Radiated emission limits 40 GHz – 231 GHz</i>		
<i>Frequency (GHz)</i>	<i>Power Density (pW/cm^2)</i>	<i>Measurement distance (m)</i>
40 – 200	600	3
above	1000	3

Note(s):

- 1 According to 47 CFR, Part 95, § 95.3379(a)(3) the spectrum shall be investigated up to 231 GHz.
- 2 The power density of 600 pW/cm^2 corresponds to a transmit power of -1.69 dBm, a field strength of 93.5 $\text{dB}\mu\text{V}/\text{m}$ for 3 m distance and 103.1 $\text{dB}\mu\text{V}/\text{m}$ for 1 m distance
- 3 The power density of 1000 pW/cm^2 corresponds to a field strength of 95.8 $\text{dB}\mu\text{V}/\text{m}$ for 3 m distance, 105.3 $\text{dB}\mu\text{V}/\text{m}$ for 1 m distance and 111.3 $\text{dB}\mu\text{V}/\text{m}$ for 0.5 m distance.

Table 2: FCC Radiated emission limits above 40 GHz

<i>Radiated emission limits 40 GHz –162 GHz</i>		
<i>Frequency (GHz)</i>	<i>Limit (dBm/MHz e.i.r.p.)</i>	<i>Detector</i>
40 – 162	-30	RMS
<p><i>Note(s):</i></p> <p>1 For radar devices that operate solely in the 76 – 76 GHz Band (i.e. the occupied bandwidth is entirely contained in the 76 – 77 GHz band), an unwanted emissions limit of 0 dBm/MHz shall apply for the unwanted emission that fall in the 73.5 – 76 GHz band. Outside the 73.5 – 76 GHz band, the unwanted emission limits prescribed above shall apply.</p>		

Table 3: ISED Radiated emission limits above 40 GHz
