

SIMILARITY LETTER***From:***

Aptiv Services Deutschland GmbH
42367 Wuppertal, Germany

Model: Radio Entertainment Module 2.1

The models described here are similar to each other, have the same RF circuit, power supply, internal circuit, enclosure, etc.

The difference (s) between the models is (are)

Inform the differences of the models:

Comparing the A2B and AMP version, with FCC ID LTQVTREMNAR granted in 11/20/2022 for the A2B variant the internal amplifier was depopulated and the adjacent circuit is not used, contrary to what exists in the AMP version. In the A2B variant, the A2B bus circuit is populated with the respective A2B phantom supply, Audio Bus Transceiver and respective connections, which was not populated in the original variant.

Both variants are built on the same PCB and are only differing in component assembly. The signal processing and input blocks (tuners, USB, BT, main micro, memories, DSP) are all identical. The only difference is audio output protocol (AMP variant is driving the cabin speakers directly, while A2B variant is passing the audio via A2B protocol to an external amplifier).
