

CERTIFICATE OF COMPLIANCE

APPLICABLE SPECIFICATIONS:

47 CFR PART 2, SUBPART J, SECTION 2.907 47 CFR PART 15, SUBPART C, SECTION 15.225 INDUSTRY CANADA RADIO STANDARD RSS-210 ISSUE 5

Report Number: 2701-1, Dated 2/22/07

I hereby certify that the measurements shown on this report were made in accordance with the procedures of American National Standards Institute (ANSI) Specification C63.4-2003. The voltages conducted along its power leads and electric fields radiated by the equipment listed below meets the Commissions Limits for a Class B CF RFID - Scan Card.

Company: Socket Mobile, Inc.
Street Address: 39700 Eureka Drive
City, State & ZIP Newark, Ca 94560
Equipment under Test: CF RFID - Scan Card

Model Number: 8510-00226, 8510-00248, 8510-00249

Serial Number: 001

EMCE Engineering, Inc. has been placed on the Federal Communications Commission's list of recognized facilities for Parts 15 and 18 DoC approvals. Per the request of EMCE Engineering, Inc., the facility has been added to the list of those who perform Measurement Services for the public on a fee basis. This list is published periodically and is also available on the FCC World Wide Web. Additionally, EMCE Engineering, Inc. has been approved by the National Institute for Standards and Technology under the NVLAP program (Lab Code 200092-0). The Line Conducted emissions (CFR 47, 15.207) and Spurious Radiated emissions (CFR 47, 15.109) results presented in this report fall under EMCE's Scope of Accreditation.

Certified By:

President EMCE Engineering

Date: 2/22/07 Page: 2 of 38

Disclaimer

EMCE Engineering, Inc., assumes no responsibility for the continuing validity of test data when the Equipment under Test is not under the continuous physical control of EMCE. The signature below attests to the fact that all measurements reported herein were performed by myself or were made under my supervision, and are correct to the best of my knowledge and belief as of the date specified. I assume full responsibility for the completeness of these measurements and vouch for the qualifications of all persons taking them. Tests were conducted by qualified EMCE Engineering, Inc. personnel utilizing test equipment maintained in a "current" state of calibration with traceability to NIST.

Date: 2/22/07 Page: 6 of 38

1.0 SCOPE

This test report describes the equipment setup, test methods employed and results obtained during electromagnetic interference (EMI) testing of a Class B CF RFID - Scan Card as defined in Part 15, Subpart A, paragraph 15.3 (o). The tests described herein measured the RF radiated (RFI Field Strength) emissions of the equipment under test (EUT) as installed in a typical "Host" environment. The tests conformed to the measurement and test site requirements of ANSI C63.4-2003.

1.1 Objective

The tests described herein were performed to establish that the EUT is capable of compliance with the requirements of Part 15, Subpart B, Section 15.225 for Intentional Radiators (a Class B CF RFID - Scan Card).

1.2 Description of EUT

The EUT is a **CF RFID** - **Scan Card** Model Number: **8510-00226**, **8510-00248**, **8510-00249** Serial Number: **001**, manufactured by Socket Mobile, Inc.. The EUT contained the following options: No Options.

Model Differences:

- M/N 8510-00226 is the RFID Reader
- M/N 8510-00248 is the RFID Reader with Class 1 Laser Scan Engine
- M/N 8510-00249 is the RFID Reader with the Class 2 Laser Scan Engine

All testing was performed on the model 8510-00249 unit, which is representative of all three model for EMC compliance purposes.

1.3 Results/Modifications

The EUT passed FCC Class B conducted and radiated emissions tests. No modification was necessary. The manufacturer may declare the EUT as complying with the FCC requirements.

Date: 2/22/07 Page: 7 of 38

1.4 Test Limits

FCC Class B Line Conducted and Unintentional Radiated emission limits are as follows:

Conducted Emission Limits (Quasi-peak)	Radiated Emission L	imits @ 10-meters
N/A due to product type	30 – 230 MHz 230 – 1000 MHz	30.0 dBuV/m 37.0 dBuV/m

3.0 GENERAL SETUP AND TEST CONDITIONS

3.1 Test Facility

The tests described herein were performed at:

EMCE Engineering, Inc. 44366 S. Grimmer Blvd. Fremont, CA 94538

This laboratory has one semi-anechoic chamber, one electromagnetic shielded enclosure and a 3-meter and 10-meter Open Area Test Site (OATS). A computer controlled spectrum analyzer with quasi-peak adapter, and printer were used for gathering and recording test data. Figure 1 shows the test site layout for conducted and radiated measurements.

3.2 Description of Open Area Test Site (OATS)

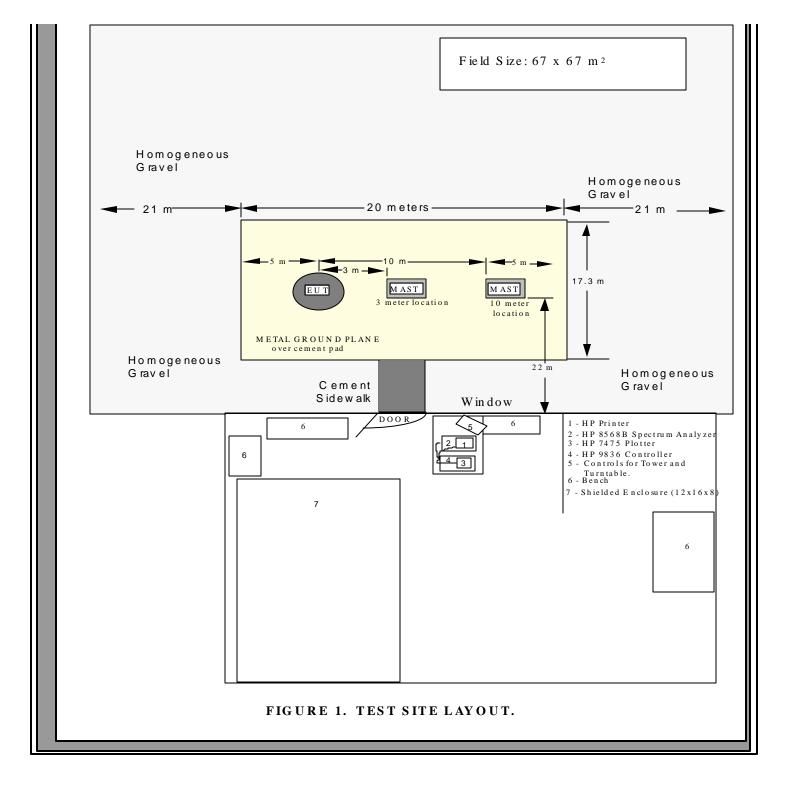

The 3 and 10 meter site is located out-of-doors in an open field whose size is 212 feet long by 206 feet wide. The dimensions of the test area are 66 feet wide by 59 feet long (20m x 18m). The description of the 3 and 10-meter site is on file with the FCC according to the requirements of Part 2.948.

3.3 Site Attenuation

The site attenuation for radiated measurements has been determined for this test site using the method described in ANSI C63.4 Paragraph 5.4.6 and sub paragraphs. The site attenuation is measured annually. Site attenuation was last measured and reported to the FCC in December 2006.

3.4 Ground Plane (Ground Screen)

The site has a 3900 square foot $(20m \ x \ 18m)$ floor area of poured reinforced concrete, 6 to 8 inches thick. A $20m \ x \ 18m$ ($66ft \ x \ 59ft$) solid 24 gauge galvanized sheet steel ground plane is centered on the test area with its long dimension along the major axis of the test site. The antenna mast and turntable are located 3 meters apart on the centerline of the major axis so that each is greater than 3 meters from the edges of the ground plane. The ground plane is connected to a nine-foot long earth ground rod at each corner of the ground plane.

Date: 2/22/07 Page: 10 of 38

3.5 Input Power for EUT

Electricity for the EUT is provided through buried power lines in metallic conduit with an outlet box placed near the EUT. Power for the EUT is taken from the outlet box of either of two "shielded enclosure" quality power line filters located on the ground plane near the EUT. The filters are electrically bonded to the ground plane.

3.6 Accessory Equipment Precautions

Care was taken that accessory equipment or adjacent equipment did not produce unacceptable interference so as to contaminate the final test data. The EMI receiver and its associated hardware were located greater than 15 meters away from the EUT during testing and were powered from a separately filtered power source.

3.7 Ambient Interference

Ambient interference from radio and television stations, vehicles, mobile radio, etc. was present at the open test site during testing. Care was taken to assure that ambient interference did not overload the measurement receiver or mask emissions from the EUT. The method of measurement used to deal with ambient noise during radiated emission testing is described in Paragraph 5.2.1.

3.8 Personnel

All testing was performed by EMCE Engineering personnel who are properly trained for the instruments and procedures used. The test data sheets have been signed-off by the attending EMCE Test Engineer.

3.9 Use of Interference Measurement Equipment

All of the emission measurements and field strength measurements were performed with a Hewlett-Packard 8566B Spectrum Analyzer System. The Spectrum Analyzer System utilizes the following basic instruments:

- 1. Fujitsu Lifebook Computer
- 2. EMITest, v4.11 measurement software
- 2. HP-85650A Quasi Peak Adapter

Date: 2/22/07 Page: 11 of 38

Test results are recorded on tabular data sheets and show final corrected values compared to the specification limit. Sample calculations show how the antenna factors, cable losses, amplifier gain, etc. are combined in the automatic analyzer program to produce the final corrected values shown on the graphs and data sheets.

3.10 Calibration of Measuring Equipment

The EMI Receiver (spectrum analyzer) is calibrated by an outside calibration laboratory on a 12-month basis. The laboratory provides certification with traceability to NIST. Antenna factors are measured at 1-year interval by EMCE Engineering using the reference antenna method of ANSI C63.5-2003. Cable losses as well as amplifier gains are swept at least every month to verify accurate values.

Date: 2/22/07 Page: 12 of 38

4.0 PREPARATION OF EUT FOR TEST

4.1 Identification of EUT

Equipment under Test: CF RFID - Scan Card

Model Number: 8510-00226, 8510-00248, 8510-00249

Serial Number: 001

4.2 Setup of EUT

Power to EUT: From PDA

Grounding of EUT: **DC Ground** Special Software: **RFID Test Demo**

- Orientation of EUT: Per CFR 47, 15.31 and ANSI 63.4-2003, for all measurements the
- *EUT* was evaluated in the X, Y, and Z orthogonal axes.
- Loop Antenna was manipulated to find the worst case emission. Positions include, but not limited to parallel and perpendicular to the EUT, and parallel to the ground

4.3 Interfaces & Cabling

The following cables were connected during test:

Interface Source Load Length Conductors Cable Connector

<u>Port Port Cable Number Type Material</u>

N/A

4.4 Peripherals

The following peripherals were attached and operating during the tests:

NomenclatureMfgr & ModelSerial NoPDADell13401d45

Date: 2/22/07 Page: 13 of 38

5.0 TEST PROCEDURES

5.1 Conducted Emissions, Power Leads, 150 kHz to 30 MHz

Not Applicable Due to Product Type (Battery Powered)

Conducted emissions were measured from 150kHz to 30MHz on the power and return leads of the EUT according to the methods defined in ANSI C63.4, Section 7.0 and the limits found in CFR 47, 15.107. The EUT was placed on a nonmetallic stand in a shielded room 0.8 meters above the ground plane and removed from the vertical ground plane by 40-cm as shown in Appendix D, Photographs of Test Setup. The interface cables and equipment positioning were varied within limits of reasonable application per Figure 9A of ANSI C63.4 to determine the position producing maximum conducted emissions.

The LISN and high pass filter were connected through 20 feet of RG-214 coaxial cable to the spectrum analyzer input. The switch on the LISN was set to the Supply Line position and the power was applied. The EUT was operated as described in Paragraph 4.0 in a mode, which was intended to produce maximum emissions for normal operation.

The switch in the LISN was then set to the Return Line position and the interference scan was repeated and an additional set of data sheets and plot charts were prepared for the return lead.

5.1.1 Test Results

Not Applicable due to product type.

5.1.2 Test Instrumentation

N/A

5.1.3 Recommendations

Due to the fact that there were no test failures, there are no recommendations.

Date: 2/22/07 Page: 14 of 38

5.2 Radiated Emissions Test, 25 MHz to 1000 MHz

Radiated emissions were measured from 25 MHz to 1000 MHz. The measurement bandwidth was 120 kHz according to the methods defined in ANSI C63.4 Section 8.0. The EUT was placed on a nonmetallic stand in the open-field site, 0.8 meters above the ground plane, as shown in Appendix D, Photographs of Test Setup.

The EUT was operated as described in Paragraph 4.0, in a mode, constantly scanning for RFID Tags, which was intended to produce maximum emissions. Preliminary scans of the frequency range were used to determine the cable configurations and equipment positions which produce maximum emissions. These configurations were then kept intact while both angle of rotation of the EUT with respect to the antenna and antenna height were scanned for maximum readings. The angles and antenna polarization are shown on the data sheets in Appendix C.

5.2.1 Test Results

The EUT passed both vertical and horizontal radiated emissions tests.

5.2.2 Test Instrumentation

See Appendix I – 1-10

5.2.3 Recommendations

Because there were no test failures, there are no recommendations.

Test Data Sheets Intentional Radiator Results

Date: 2/22/07 Page: 24 of 38

INTENTIONAL RADIATOR

Maximum allowed field strength in the frequency range of 13.553-13.567 MHz is 15,848 microvolts per meter, or 84 dBuV/M at a test distance of 30 meters. Test distance for this measurement is 1 meter. The calculation for determining the field strength limit at 1 meter is as follows:

Correction Factor = 40 log (distance 1 / distance 2) Correction Factor = 40 log (30/1) Correction Factor = 59.1 dBuV/M

Therefore, the limit used for this measurement is 143.1 dBuV/M

Test results show compliance to the limits called out in CFR 47, Section 15.225 (a), (b), (c), (d) and (e), as well as RSS-210 6.2.2(e) as follows:

Date: 2/22/07 Page: 25 of 38

APPENDIX E

CERTIFICATION LABELING AND COMPLIANCE INFORMATION

Date: 2/22/07 Page: 33 of 38

CERTIFICATION LABELING AND COMPLIANCE INFORMATION

If a product must be tested and require Certification, a Compliance Information Statement shall be supplied with the product at the time of marketing or importation. The compliance information statement shall contain the information as shown:

COMPLIANCE INFORMATION STATEMENT

Product Name: CF RFID - Scan Card

Product Model Number: 8510-00226, 8510-00248, 8510-00249

This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) This device may not cause harmful interference, and (2) This device must accept any interference received, including interference that may cause undesired operation.

Identification

Devices subject Certification shall be uniquely identified by the responsible party. This identification shall be of a format consisting of the FCC Identifierand IC number, e.g.:

FCC ID: LUBRFID002 IC: 2529A-RFID002

Labeling Requirements

Product authorizations subject to Certification shall have a label as follows:

The label shall be located in a conspicuous location on the device and shall contain as a minimum the unique identification of "Trade Name" and "Model Number" along with the FCC 2 part statement, as well as the FCC Identifier and IC number.

Date: 2/22/07 Page: 34 of 38

Retention of Records

For each product subject to Certification, the responsible party shall maintain the records listed below:

- A) A record of the original design drawings and specifications and all changes that have been made that may affect compliance with the FCC requirements.
- B) A record of the procedures used for production inspection and testing (if tests were performed) to insure the continuous conformance required. (Statistical production line emission testing is not required).
- C) A record of the measurements made on an appropriate test site that demonstrates compliance with the applicable regulations.

APPENDIX F

Measuring Equipment Error Analysis

Date: 2/22/07 Page: 36 of 38

MEASURING EQUIPMENT ERROR ANALYSIS

Radiated Emissions Measurement

Table 1 shows the calculated measurement accuracy for radiated emissions test (9kHz-1000MHz). The radiated emissions amplitude accuracy is determined as follows: Antenna Factor Error + Cable Loss Error + Pre-amplifier Gain Error + Spectrum Analyzer Amplitude Error. The spectrum analyzer amplitude error is obtained from the manufacturer's specification sheet. Antenna factors are measured at 1 year intervals by EMCE Engineering, and cable losses as well as amplifier gains are swept at least every month by EMCE Engineering to verify accurate values. The measurement accuracy for these are determined by EMCE.

Table 1
Radiated Emissions Measurement Accuracy

Equipment	Manufacturer	Model	Accuracy
Spectrum Analyzer	Hewlett-Packard	8568B	+/- 1.6dB
Antennas	EMCO/Roberts	3104/Empire	+/- 1.0dB
Pre-amplifier	Hewlett-Packard	8447D	+/- 0.5dB
Double Shielded Coax Cable	50 ohm, Type N	50 feet	+/- <u>0.5dB</u>
			= +/- 3.6dB

Conducted Emissions Measurement

Table 2 shows the calculated measurement accuracy for conducted emissions test (150kHz-30MHz). The conducted emissions amplitude accuracy is determined as follows: LISN Attenuation Error + Cable Loss Error + Spectrum Analyzer Amplitude Error. The spectrum analyzer amplitude error and LISN attenuation error are obtained from the manufacturer's specification sheet. Cable loss below 30MHz is negligible therefore error presented by the cable is not considered.

Table 2
Conducted Emissions Measurement Accuracy

Equipment	<u>Manufacturer</u>	<u>Model</u>	<u>Accuracy</u>
Spectrum Analyzer	Hewlett-Packard	8568B	+/- 1.6dB
LISN	EMCO	3816/2	+/- <u>0.5dB</u>
			= +/- 2.1dB
