End of Report		51

NOTICE:

(1) This Report must not be used to claim product endorsement, by NVLAP, NIST, the FCC or any other Agency. This report also does not warrant certification by NVLAP or NIST.

(2) This report shall not be reproduced except in full, without the written approval of Professional Testing (EMI), Inc.

(3) The significance of this report is dependent on the representative character of the test sample submitted for evaluation and the results apply only in reference to the sample tested. The manufacturer must continuously implement the changes shown herein to attain and maintain the required degree of compliance.

Certificate of Compliance

Applicant	Device & Test Identification	
Hetronic 3905 NW 36th St. Oklahoma City, OK 73112 USA Certificate Date: 28 Mar 2017	FCC ID:	LW9-CSM400UE
	IC ID:	2119-CSM400UE
	Model(s):	CSM-400UE
	Laboratory Project ID:	17266-15

The device model(s) listed above were tested utilizing the following documents and found to be in compliance with the required criteria.

47 CFR (USA) FCC, RSS IC(Industry Canada)		
Parameter	FCC	IC
Conducted Output Power	90.210, 2.1046	RSS-119 Issue 12, 5.4
Emission Mask C	90.210(c), 2.1047	RSS-119 Issue 12, 5.8.3

I, Eric Lifsey, for Professional Testing (EMI), Inc., being familiar with the above rules and test procedures have reviewed the test setup, measured data, and this report. I believe them to be true and accurate.

Eric Lifsey
EMC Engineer

This report has been reviewed and accepted by the Applicant. The undersigned is responsible for ensuring that this device will continue to comply with the requirements listed above.

Representative of Applicant

1.0 Introduction

1.1 Scope

This report describes the extent to which the equipment under test (EUT) conformed to the intentional radiator requirements of North America.

Professional Testing (EMI), Inc., (PTI) follows the guidelines of National Institute of Standards and Technology (NIST) for all uncertainty calculations, estimates, and expressions thereof for electromagnetic compatibility testing. The methods of TIA/EIA-603 were applied unless specified otherwise in the associated agency rules and procedures.

1.2 EUT Description

The EUT is a transceiver module used in the manufacturer's systems that transmit and receive control codes with associated wireless devices in industrial environments. It receives power, control, and data signals from the host system. The EUT supports external antennas, or a cable thereto, attached to the modules SMB connector.

Table 1.2.1 Equipment Under Test			
Manufacturer & Description	Model	Serial #	Photo
Hetronic Transceiver module for 410 to 475 MHz.	CSM-400UE	none	 <p>Module appearance, shield removed.</p>

Table 1.2.2 Options		
Manufacturer & Description	Gain	Notes
Hetronic; ¼ wave SMB whip antenna	1 dBi	For use directly on module with host.
Hetronic; cable extension to TNC-F	NA	Extends module to external antenna.
Hetronic; ¼ wave TNC-M antenna	4 dBi	External antenna.

1.3 EUT Operation

The EUT was exercised in a manner consistent with normal operations. It was tested alone with no additional shielding or filtering. It was powered by a linear DC power supply.

The module is normally used as a transmitter in portable battery or vehicular powered applications. The module is normally used as a receiver in vehicular or mains powered applications. The mains powered hosts are tested for emission compliance separately.

Table 1.3.1 Operating Frequency/Range			
Lowest Frequency	Center Frequency	Highest Frequency	Total Frequency Range
410.000 MHz	442.500 MHz	475.000 MHz	65 MHz
The three channels were tested per customary practice for a frequency range exceeding 10 MHz.			

1.3.1 Operation with External Amplifiers under 120 mW

When operated alone or with optional external amplifier with power under 120 mW all symbol rates are supported. In this case the 90.217 exemption (30 dBc mask) applies and the EUT satisfies the spectrum efficiency requirement where power is under 500 mW.

1.3.2 Operation with External Amplifiers above 120 mW

When operating with optional external power amplifier with power above 120 mW the symbol rates above 9600 use a lower deviation setting. In this case Mask C applies.

1.4 Modifications to Equipment

No modifications were made to the EUT during the performance of the test program.

1.5 Test Site

Measurements were made at the PTI semi-anechoic facility designated Site 45 (FCC 459644, IC 3036B-1) in Austin, Texas. The site is registered with the FCC under Section 2.948 and Industry Canada per RSS-Gen, and is subsequently confirmed by laboratory accreditation (NVLAP). The test site is located at 11400 Burnet Road, Austin, Texas 78758, while the main office is located at 1601 North A.W. Grimes Boulevard, Suite B, Round Rock, Texas, 78665.

1.6 Applicable Documents

Table 1.6.1: Applicable Documents		
Document #	Title/Description	Date
47 CFR	FCC Part 90	
IC RSS-119 Issue 12	Land Mobile and Fixed Equipment Operating in the Frequency Range 27.41-960 MHz	2015
IC RSS-Gen Issue 4	General Requirements for Compliance of Radio Apparatus	2014
TIA/EIA-603D	Land Mobile FM or PM – Communications Equipment – Measurement and Performance Standards	2009

2.0 Conducted Output Power

2.1 Procedure

The EUT is placed into continuous transmit mode without modulation for peak power measurement.

2.2 Criteria

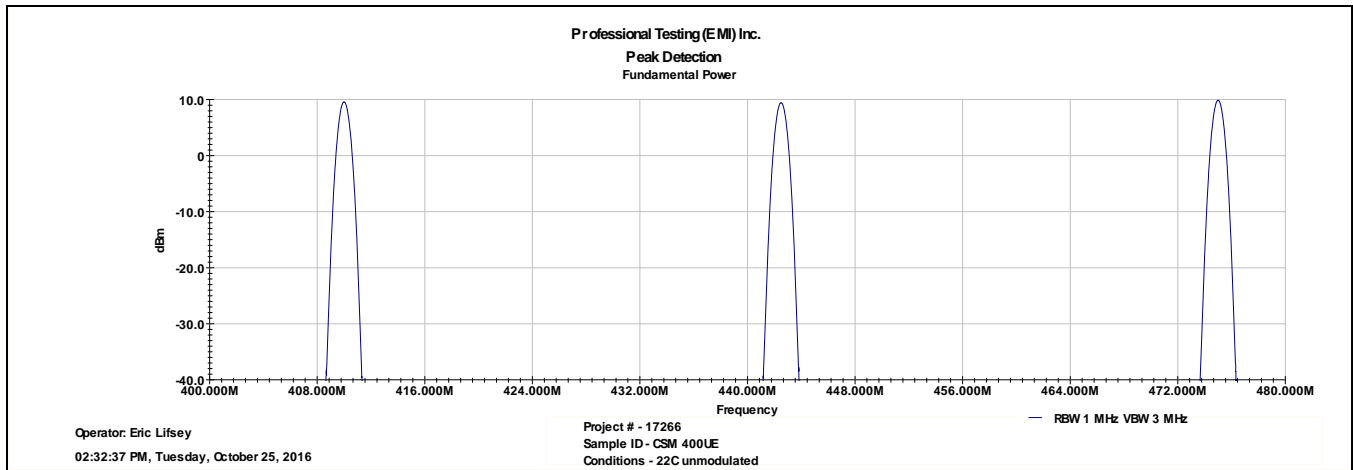

Parameter	Section Reference	Date
Conducted Output Power	90.210, 2.1046 RSS-119 Issue 12, 5.4	25 Oct 2016

2.3 Results

EUT antenna port was directly coupled to the spectrum analyzer without a cable so power was read directly with no factors required.

The EUT satisfied the requirement. Tabular results are presented below.

Frequency (MHz)	Power (dBm)	Power (mW)
410.000	9.6	9.1
442.500	9.4	8.7
475.000	9.9	9.8

3.0 Emission Mask

3.1 Procedure

Emissions are measured with peak detector with the mask superimposed on the graph.

3.2 Criteria

Parameter	Section Number	Date
Emissions at Antenna Terminals	90.210(c), 90.217(b), 2.1047 RSS-119 Issue 12, 5.8.3	8/9 Nov 2016 7 Feb 2017

3.3 Results

The emission was measured coupled directly to the analyzer without cabling. The EUT satisfied the requirement.

Measurements appear on the following pages.

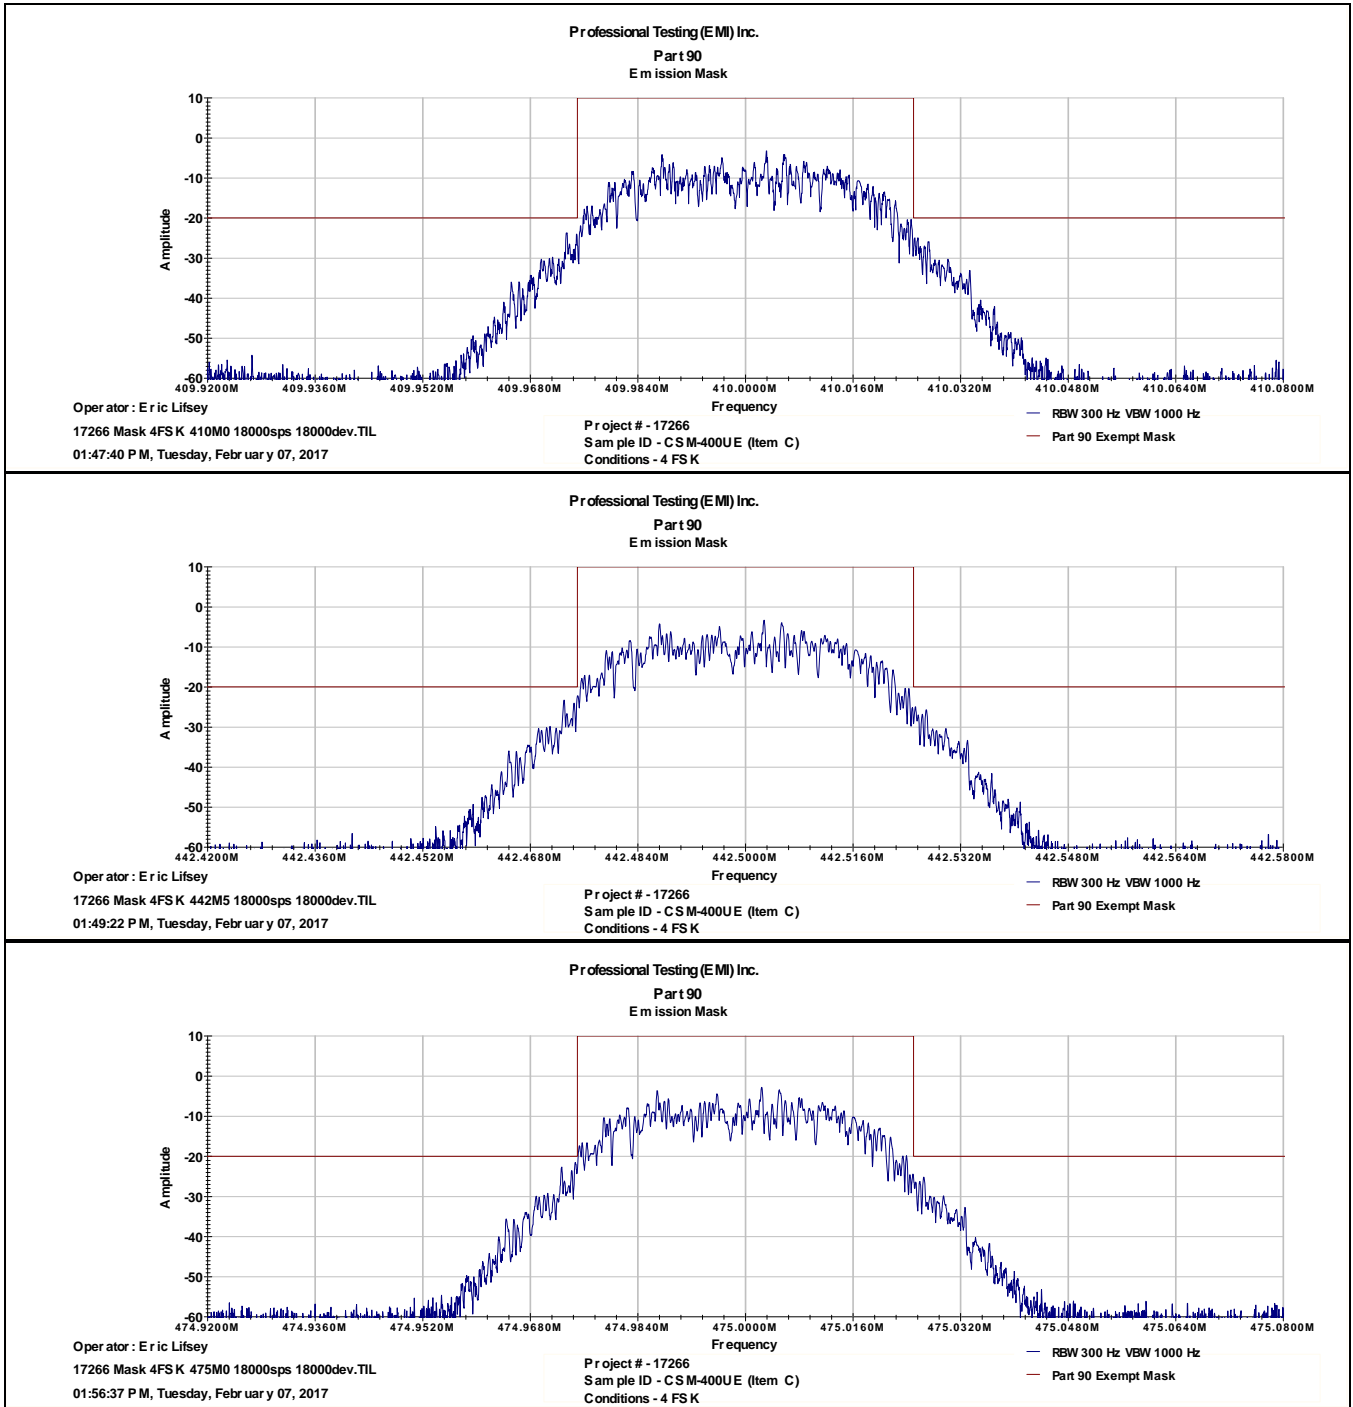

3.3.1 Modulation 2GFSK at 4800 Symbols per Second

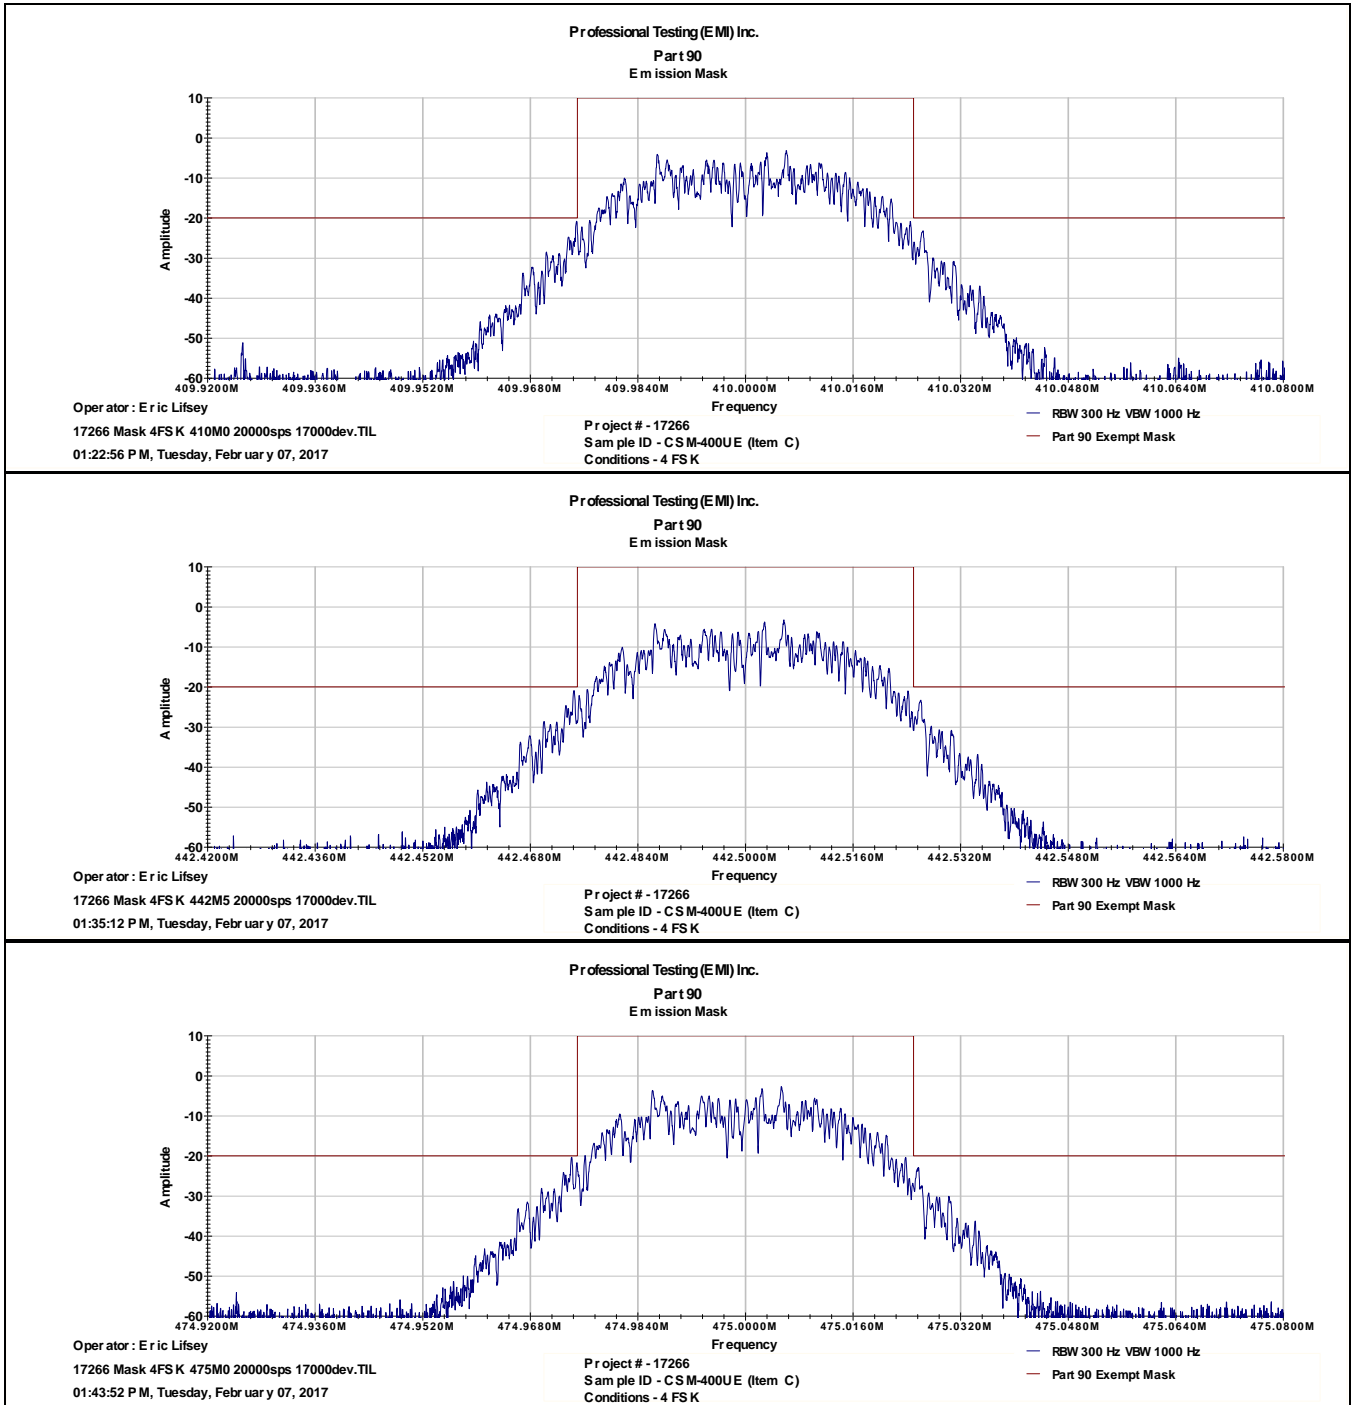

3.3.2 Modulation 2GFSK at 9600 Symbols per Second

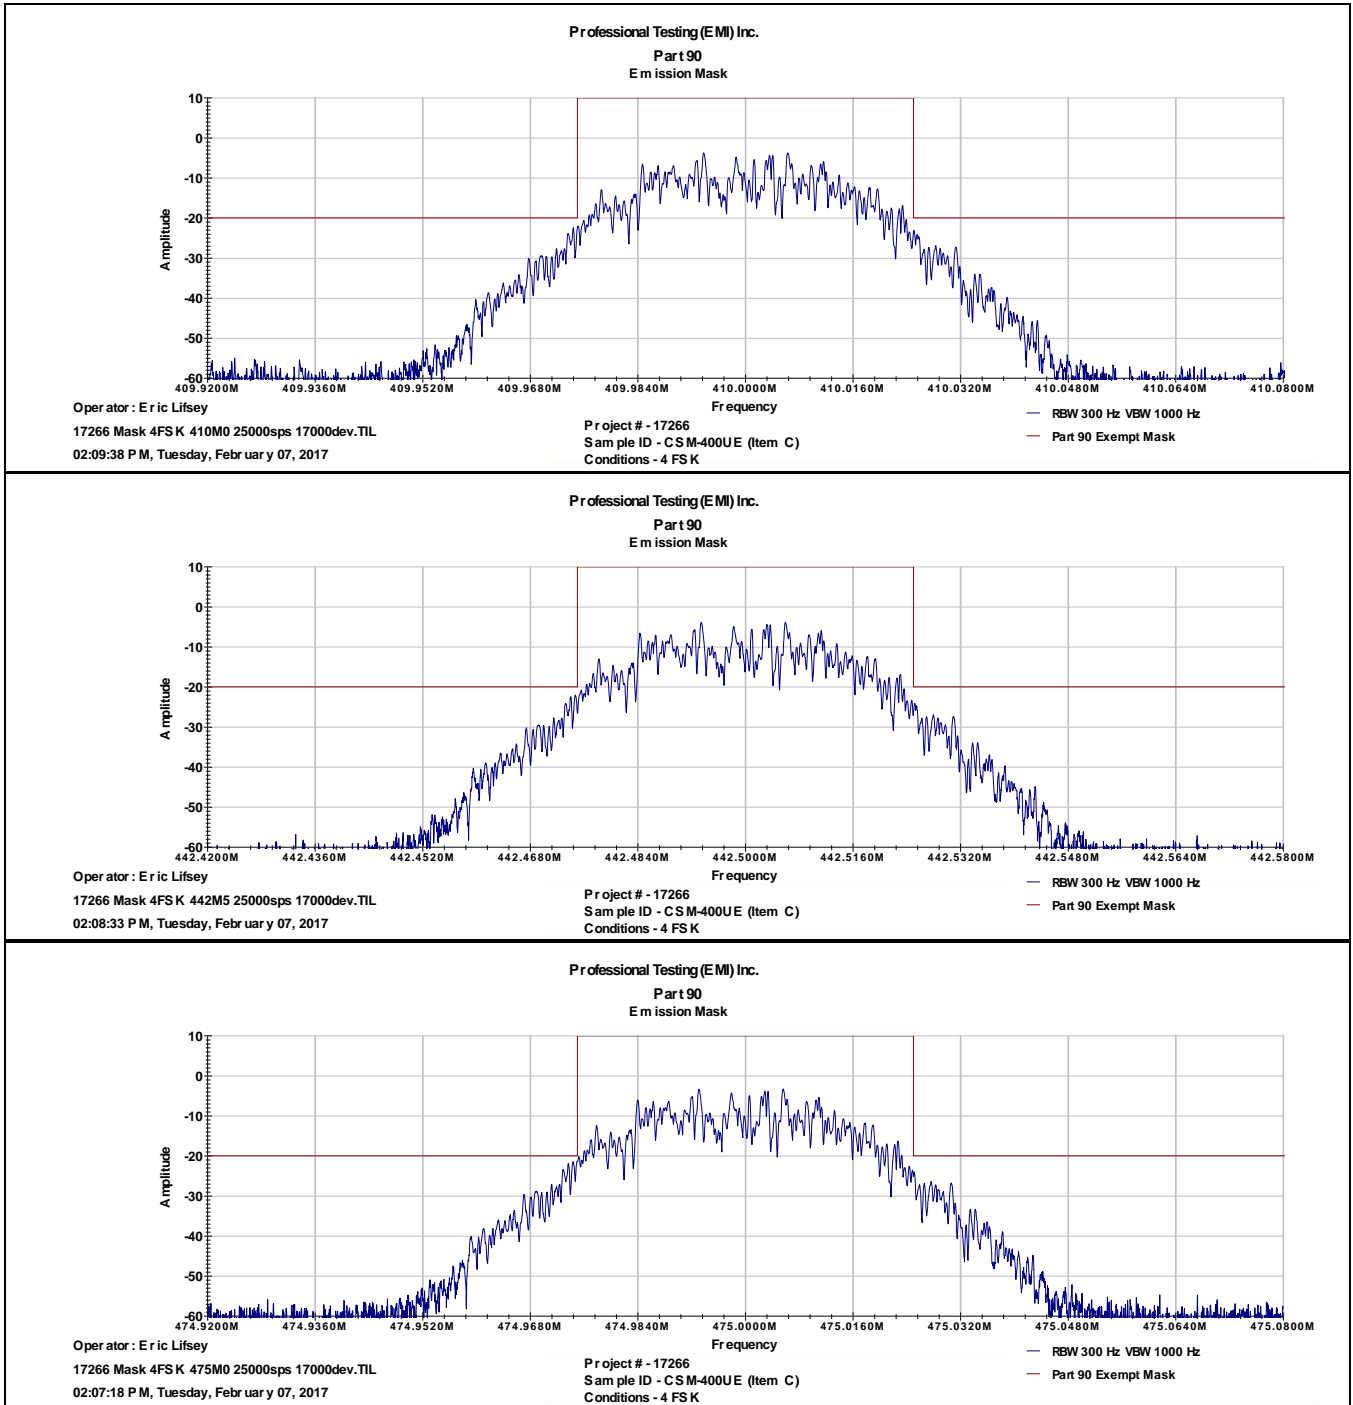

3.3.3 Modulation 4GFSK at 18000 Symbols per Second with 18000 Hz Deviation

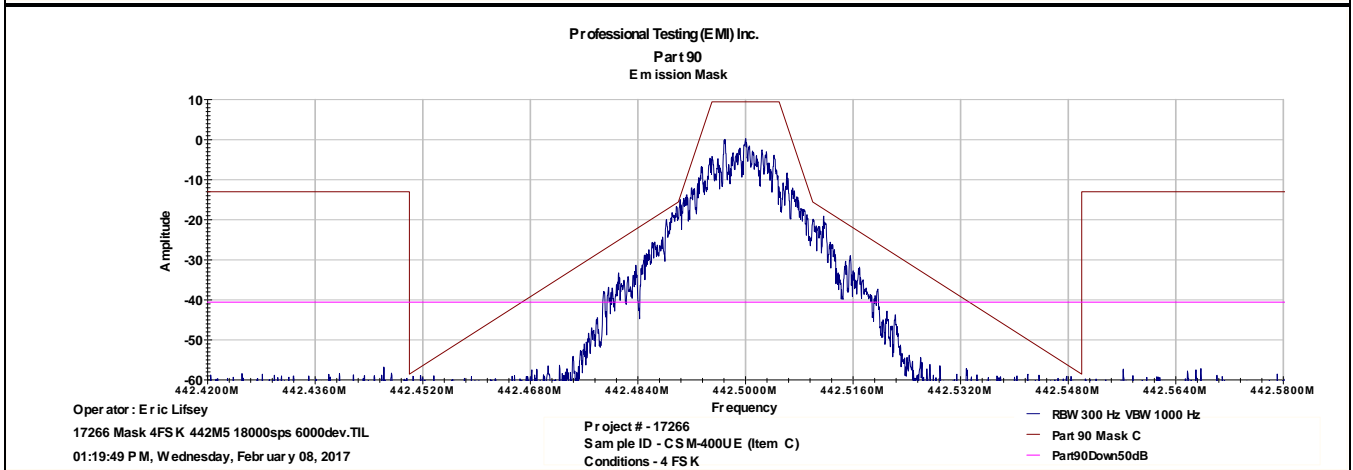

3.3.4 Modulation 4GFSK at 20000 Symbols per Second with 17000 Hz Deviation

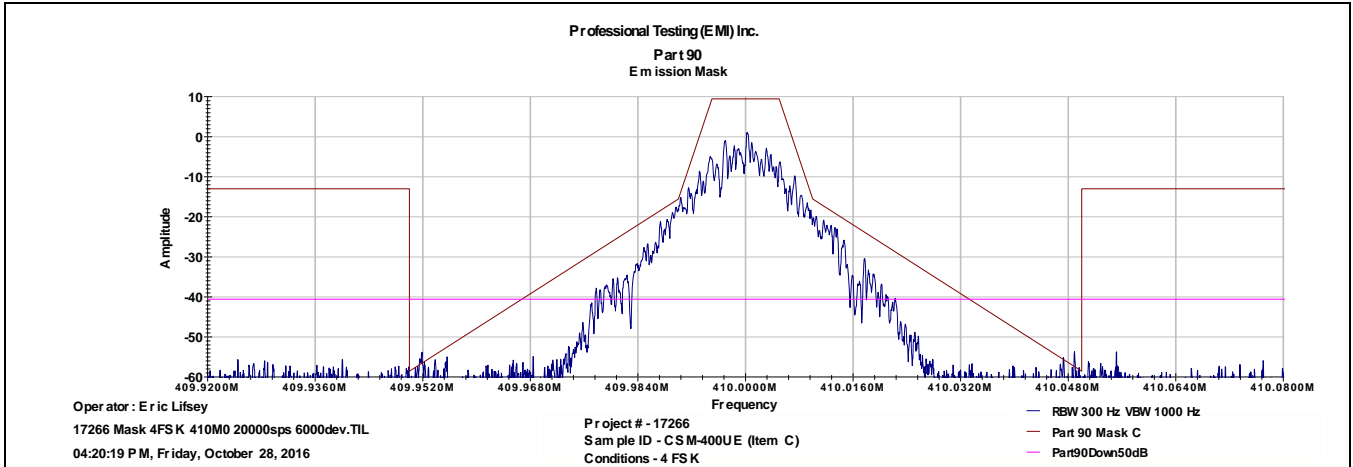

3.3.5 Modulation 4GFSK at 25000 Symbols per Second with 17000 Hz Deviation

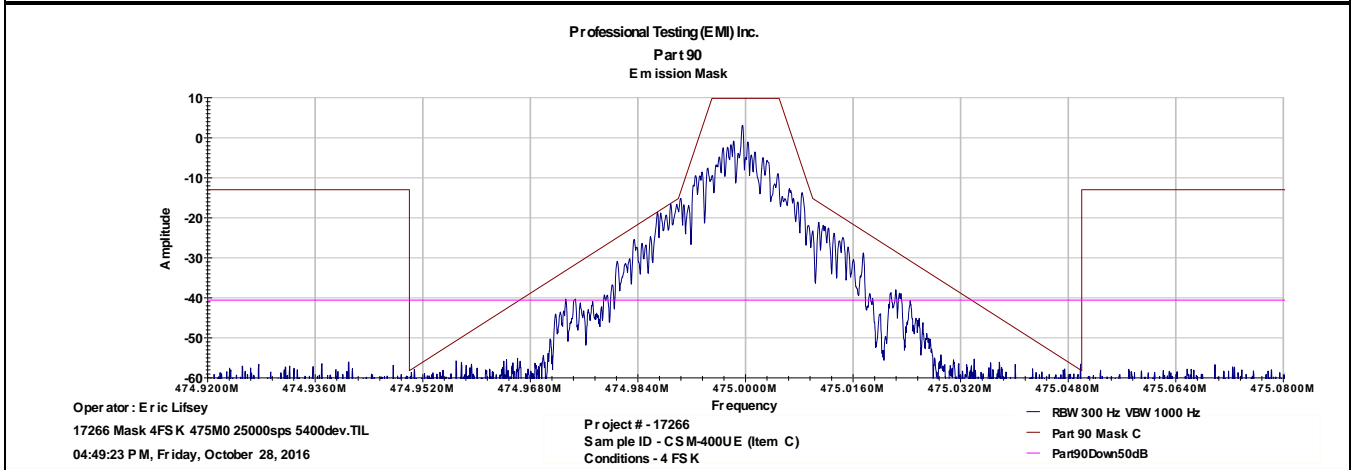

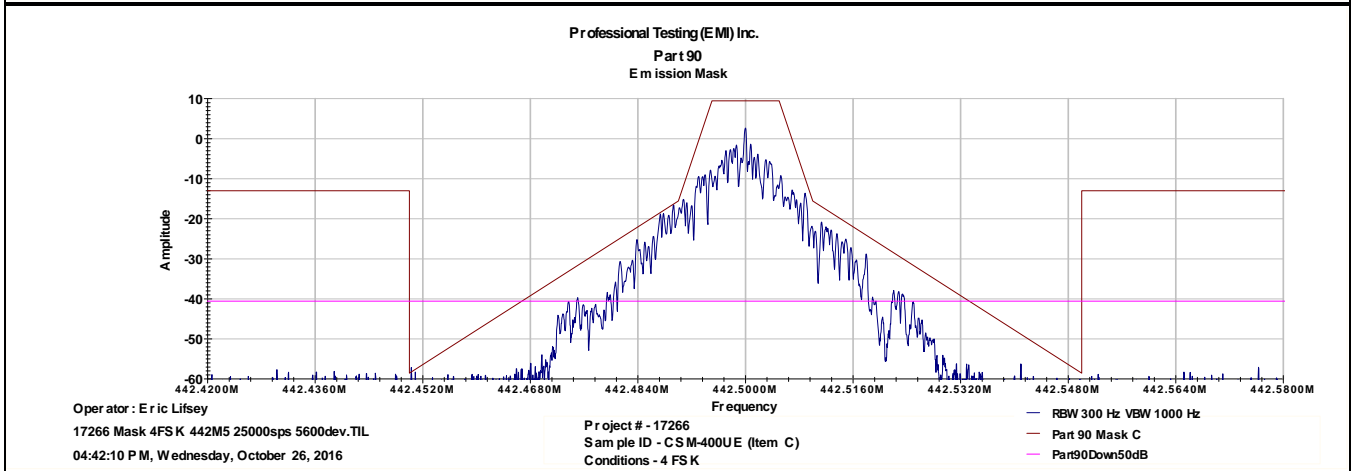

3.3.6 Modulation 4GFSK at 18000 Symbols per Second with 6000 Hz Deviation, Mask C

3.3.7 Modulation 4GFSK at 20000 Symbols per Second with 5400 Hz Deviation, Mask C

3.3.8 Modulation 4GFSK at 25000 Symbols per Second with 5400 Hz Deviation, Mask C

4.0 Spurious Emissions at Antenna Terminals

4.1 Procedure

The EUT antenna port is coupled through a power attenuator to a spectrum analyzer and then is placed into continuous transmit mode without modulation. The connection is direct and no cables are used. Spurious signals are then measured directly with no additional calculation required. Emissions are measured with a peak detector function from 9 kHz to 5 GHz to include the tenth harmonic 4.75 GHz.

4.2 Criteria

Parameter	Section Number	Date
Emissions at Antenna Terminals	90.210(b), 2.1047 RSS-119 Issue 12, 5.8	7 Nov 2016

Limit is determined from for emissions beyond 250% of authorized bandwidth.

Per 90.210(c)(3) $\text{Attenuation}_{(\text{dB})} = 43 + 10 \text{Log}_{10}(0.0098 \text{ W}) = 22.9 \text{ dB}$

$\text{Limit}_{(\text{dBm})} = \text{Fundamental_Power}_{(\text{dBm})} - \text{Attenuation}_{(\text{dB})} = 9.9 \text{ dBm} - 22.9 \text{ dB} = -13 \text{ dBm}$

4.3 Results

Measurements were performed with a direct connection to the spectrum analyzer such that no external losses or gains would apply. Measurement bandwidth is detailed in the graphs provided.

The EUT was found to be in compliance with applicable requirements.

In the plots the licensed emission limit is shown as a solid red line at -13 dBm.

As supplemental information, the -41 dBm general emission limit was included as a dashed red line. It can be seen that both transmit and receive modes satisfy the general emission limit.

Measurements appear below.

4.3.1 Transmit Mode, Bottom Channel

4.3.2 Transmit Mode, Middle Channel

4.3.3 Transmit Mode, Top Channel

4.3.4 Receive Mode, Middle Channel

5.0 Field Strength of Radiated Spurious Emissions

5.1 Procedure

The EUT was placed on a non-conductive table 0.8 meters above the ground plane. The table was centered on a rotating turntable at a distance of 10 meters from the measurement antenna. The EUT was placed into transmit mode with the antenna removed and a resistive terminator substituted.

5.2 Criteria

Parameter	Section Number	Date
Field Strength of Radiated Emissions 30 MHz to 5 GHz	90.210, 15.209, 2.1053 RSS-119 Issue 12, 5.8; RSS-Gen Issue 4	2016

5.3 Results

The emission limits for the module were determined as follows:

Limit is determined from for emissions beyond 250% of authorized bandwidth.

Per 90.210(c)(3) $\text{Attenuation}_{(\text{dB})} = 43 + 10 \text{Log}_{10}(0.0098 \text{ W}) = 22.9 \text{ dB}$

$\text{Limit}_{(\text{dBm})} = \text{Fundamental_Power}_{(\text{dBm})} - \text{Attenuation}_{(\text{dB})} = 9.9 \text{ dBm} - 22.9 \text{ dB} = -13 \text{ dBm}$

The EUT satisfied the requirement. Measurements appear below.

6.0 Frequency Stability

6.1 Procedure

The EUT is placed into a temperature chamber with a cable coupling the transmitted signal to a spectrum analyzer. On reaching each set point temperature, the EUT is allowed to soak at least 10 minutes without power applied. After soak time was satisfied, the EUT is powered on in transmit mode and the frequency is observed until it becomes stable; then the measurement of frequency is taken.

6.2 Criteria

Parameter	Section Number	Date
Frequency Stability	90.213 RSS-119 Issue 12, 5.3	4 Nov 2016

Table 6.2.1 Frequency Tolerance

± 5 ppm or restated as ± 2050 Hz

Table 6.2.2 Operating Voltages (From manufacturer's specifications.)

Low	Nominal	High
3.3	4.2	5.1

The operating frequency shall remain within the required tolerance.

6.3 Results

The highest deviation from frequency observed was 1212 Hz. The EUT satisfied the requirement. Measurements appear below.

6.3.1 Bottom Channel, Temperature

Condition	Frequency		Deviation
Temperature (C)	Reference Center Frequency (MHz)	Measured Frequency (MHz)	Calculated Deviation (Hz)
-30	410.000000	409.999632	-368
-20	410.000000	409.999825	-175
-10	410.000000	409.999814	-186
0	410.000000	409.999818	-182

High	5.10	475.000000	474.999122	-878

7.0 Transient Frequency Behavior

The EUT was tested for transient frequency behavior using the test method outlined in TIA/EIA-603C paragraph 2.2.19.3 Alternate Method of Measurement (Using a Test Receiver).

Refer to diagram of TIA-603-C page 99 and the procedure of 2.2.19.3.

The EUT is terminated with a suitable resistive attenuator with the output connected to a forward power coupler. The coupler forward output (-10 dB) is run through a detector diode then to the trigger input port of a digital oscilloscope. The RF pass-through output of the coupler is then run to a 3 port resistive power combining network; the #2 port of the combiner is connected to the output of a RF signal generator, the #3 port is used as output and connected to a test receiver (modulation analyzer). The detected output of the modulation analyzer is connected to the vertical input of the digital oscilloscope.

The RF generator is set to the fundamental operating frequency, set to modulate with a 1 kHz tone at +/- 25 kHz FM deviation, and at a relatively low but usable level where the modulation analyzer is able to demodulate the signal. The modulation analyzer is configured to use the high and low pass filter settings as called out in the TIA-603-C procedure. The modulation analyzer is then dialed via front panel keypad to the fundamental operating frequency for best sensitivity.

The transmitter is keyed as needed and adjustments are made to the instruments to trigger appropriately and render the measurement as required by the TIA-603-C standard. The essential technique is the signal generator provides a reference frequency captured by the modulation analyzer. When the EUT is keyed, at many dB above the signal generator level, the modulation analyzer locks to the EUT signal and deviation from center frequency can be observed and recorded on the digital oscilloscope.

7.1 Criteria

Parameter	Section Reference	Date
Transient Frequency Behavior	90.214 RSS-119 Issue 12, 5.9 Procedure: TIA-603-C	7 Nov 2016

Table 7.1.1 Transient Frequency Limits			
Time intervals ^{1,2}	Maximum frequency difference ³	Frequency Range	
		150 to 174 MHz	421 to 512 MHz
Transient Frequency Behavior for Equipment Designed to Operate on 25 kHz Channels			
t ₁ ⁴	±25.0 kHz	5.0 ms	10.0 ms
t ₂	±12.5 kHz	20.0 ms	25.0 ms
t ₃ ⁴	±25.0 kHz	5.0 ms	10.0 ms
Transient Frequency Behavior for Equipment Designed to Operate on 12.5 kHz Channels			
t ₁ ⁴	±12.5 kHz	5.0 ms	10.0 ms
t ₂	±6.25 kHz	20.0 ms	25.0 ms
t ₃ ⁴	±12.5 kHz	5.0 ms	10.0 ms
Transient Frequency Behavior for Equipment Designed to Operate on 6.25 kHz Channels			
t ₁ ⁴	±6.25 kHz	5.0 ms	10.0 ms
t ₂	±3.125 kHz	20.0 ms	25.0 ms
t ₃ ⁴	±6.25 kHz	5.0 ms	10.0 ms

¹_{on} is the instant when a 1 kHz test signal is completely suppressed, including any capture time due to phasing.

t_1 is the time period immediately following t_{on} .

t_2 is the time period immediately following t_1 .

t_3 is the time period from the instant when the transmitter is turned off until t_{off} .

t_{off} is the instant when the 1 kHz test signal starts to rise.

²During the time from the end of t_2 to the beginning of t_3 , the frequency difference must not exceed the limits specified in §90.213.

³Difference between the actual transmitter frequency and the assigned transmitter frequency.

⁴If the transmitter carrier output power rating is 6 watts or less, the frequency difference during this time period may exceed the maximum frequency difference for this time period.

The measurement is performed for the lowest, middle, and highest operating frequency.

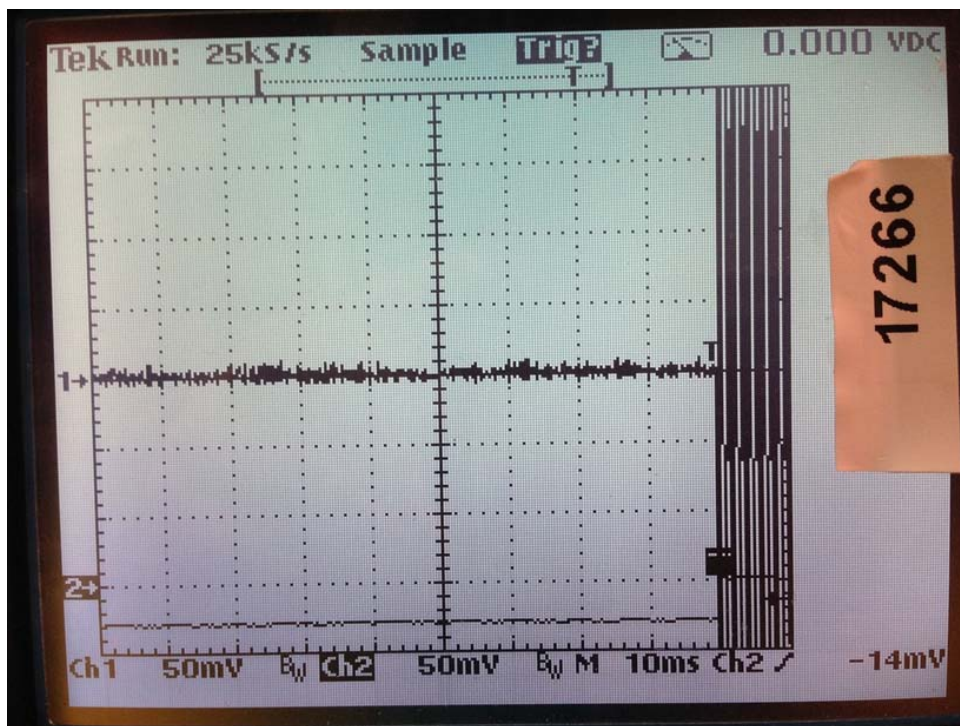

7.2 Results

The EUT satisfied the requirements. Plotted measurements appear on the following pages. The limits were not superimposed on the plots as the transmitter performance was clearly in compliance for any allowed channel scheme.

7.2.1 Bottom Channel

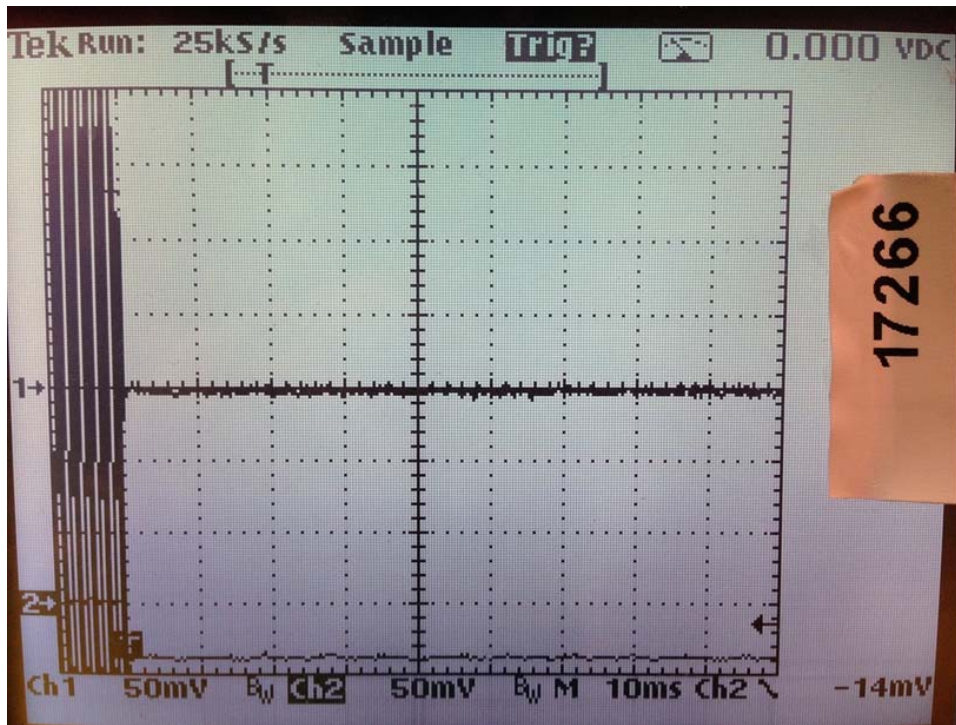

Attack

Release

7.2.2 Middle Channel

Appendix: Policy, Rationale, and Evaluation of EMC Measurement Uncertainty

All uncertainty calculations, estimates and expressions thereof shall be in accordance with NIST policy. Since PTI operates in accordance with NIST (NVLAP) Handbook 150-11: 2007, all instrumentation having an effect on the accuracy or validity of tests shall be periodically calibrated or verified traceable to national standards by a competent calibration laboratory. The certificates of calibration or verification on this instrumentation shall include estimates of uncertainty as required by NIST Handbook 150-11.

1. Rationale and Summary of Expanded Uncertainty.

Each piece of instrumentation at PTI that is used in making measurements for determining conformance to a standard (or limit), shall be assessed to evaluate its contribution to the overall uncertainty of the measurement in which it is used. The assessment of each item will be based on either a type A evaluation or a type B evaluation. Most of the evaluations will be type B, since they will be based on the manufacturer's statements or specifications of the calibration tolerances, or uncertainty will be stated along with a brief rationale for the type of evaluation and the resulting stated uncertainties.

The individual uncertainties included in the combined standard uncertainty for a specific test result will depend on the configuration in which the item of instrumentation is used. The combination will always be based on the law of propagation of uncertainty. Any systematic effects will be accommodated by including their uncertainties, in the calculation of the combined standard uncertainty; except that if the direction and amount of the systematic effect cannot be determined and separated from its uncertainty, the whole effect will be treated as uncertainty and combined along with the other elements of the test setup.

Type A evaluations of standard uncertainty will usually be based on calculating the standard deviation of the mean of a series of independent observations, but may be based on a least-squares curve fit or the analysis of variance for unusual situations. Type B evaluations of standard uncertainty will usually be based on manufacturer's specifications, data provided in calibration reports, and experience. The type of probability distribution used (normal, rectangular, a priori, or u-shaped) will be stated for each Type B evaluation.

In the evaluation of the uncertainty of each type of measurement, the uncertainty caused by the operator will be estimated. One notable operator contribution to measurement uncertainty is the manipulation of cables to maximize the measured values of radiated emissions. The operator contribution to measurement uncertainty is evaluated by having several operators independently repeat the same test. This results in a Type A evaluation of operator-contributed measurement uncertainty.

A summary of the expanded uncertainties of PTI measurements is shown as Table 1. These are the worst-case uncertainties considering all operative influence factors.

Table 1: Summary of Measurement Uncertainties for Site 45

Type of Measurement	Frequency Range	Meas. Dist.	Expanded Uncertainty U, dB (k=2)
Mains Conducted Emissions	150 kHz to 30 MHz	N/A	2.9
Telecom Conducted Emissions	150 kHz to 30 MHz	N/A	2.8
Radiated Emissions	30 to 1,000 MHz	10 m	4.8
	1 to 18 GHz	3 m	5.7
