4.4 Measurement Protocol for FCC

4.4.1 GENERAL INFORMATION

4.4.1.1 Test Methodology

The maximum total power input to the antenna has been measured conducted. Through the Friis transmission formula, which is a far field assumption and the known maximum gain of the antenna, the maximum MPE at a distance of 20 cm away from the product, can be calculated.

Friis Formula

$$\text{Friis transmission formula: } P_d = \frac{P_{out} * G}{4 * \Pi * r^2}$$

where

P_d = power density in mW/cm^2

P_{out} = output power to antenna in mW

G = gain of antenna (linear scale)

r = distance between antenna and observation point [cm]

4.4.1.2 Justification

The Equipment Under Test (EUT) is configured in a typical user arrangement in accordance with the manufacturer's instructions.

4.4.2 DETAILS OF TEST PROCEDURES

The test methods used comply with ANSI/IEEE C95.1-1992, "IEEE Standard for Safety Levels with respect to Human Exposure to Radio Frequency Electromagnetic Fields, 3 kHz to 300 GHz".

This test report shows the compliance with the limits for Maximum Permissible Exposure (MPE) specified in FCC 1.1310 and the criteria to evaluate the environmental impact of human exposure to radio-frequency (RF) radiation as specified in FCC 1.1307(b).

Limits for Maximum Permissible Exposure (MPE)

Frequency Range (MHz)	Electric Field Strength (V/m)	Magnetic Field Strength (A/m)	Power Density (mW/cm^2)	Averaging Time (minutes)
(A) Limits for Occupational / Controlled Exposure				
300-1500	---	---	f/300	6
1500-100000	---	---	5.0	6
(B) Limits for General Population / Uncontrolled Exposure				
300-1500	---	---	f/1500	30
1500-100000	---	---	1.0	30

f = Frequency in MHz

5 TEST CONDITIONS AND RESULTS

5.1 Maximum Permissible Exposure (MPE)

For test instruments and accessories used see section 6 Part **MPE**.

5.1.1 Description of the test location

Test location: AREA4

5.1.2 Description of Measurement

Conducted maximum output power:

5.1.2.1 Test procedure in the 2.4 GHz band

At first the output of the EuT has been connected by a diode detector to an oscilloscope. Than the EuT has been replaced by a generator and adjusted to the center frequency of the measured channel of the EuT. Record the output power of the generator.

5.1.2.2 Test procedure in the 5 GHz band

A spectrum analyzer has been connected to the ouput of the transmitter via a suitable attenuator while EuT was operating in transmit mode using the assigned frequency.

Analyzer Settings:

- Detector: Peak detektor
- RBW: 1 MHz
- VBW: $\geq 1/T$
- Sweep Time: free run
- Band power measurement function

Computing power by integrating the spectrum across the 26 dB EBW or apply a bandwidth correction factor of $10 \log (\text{EBW} / 1\text{MHz})$ to the spectral peak of the emission. The integration has been performed using the spectrum analyzer's band power measurement function with band limits set equal to the band edges.

5.1.3 Compliance regarding co-location and co-transmission

There is no co-location issue with 2 and 3 transmitters operating simultaneously. The reason for this is, that one module with the test software transmits with the highest possible duty cycle. If more than one module is active, the duty cycle for each module will be reduced. It is not possible (controlled by host computer) that the modules transmit at the same time slot.
