Dosimetric Assessment of the Portable Device

Integrated Service Information Display (ISID) from Siemens (FCC ID: LYHISID0001)

According to the FCC Requirements

Executive Summary

The ISID is a service and operation tool intended for the use in the shop-floor level. The ISID device is a tablet PC from Siemens operating in the 2.4 GHz and 5.0 GHz frequency range. The device has integrated antennas (1 x Bluetooth and 3 x WLAN) and the system concepts used are the Bluetooth (lesswire modul, FCC ID: LYHBTCOMB01) and IEEE 802.11 a/b/g/n (INTEL module, FCC ID: PD94965AAGN) standards.

The objective of the measurements done by IMST was the dosimetric assessment of one device in body worn configuration in the Bluetooth and WLAN standards. The device was tested in the worst case positions with the housing of the tablet PC in direct contact against the flat phantom. The examinations have been carried out with the dosimetric assessment system „DASY4“.

The measurements were made according to the Supplement C to OET Bulletin 65 of the Federal Communications Commission (FCC) Guidelines [OET 65] for evaluating compliance of mobile and portable devices with FCC limits for human exposure (general population) to radiofrequency emissions. Additional information and guidelines given by the following FCC document were used: SAR Measurement Procedures for 802.11 a/b/g Transmitters [FCC 802.11]. All measurements have been performed in accordance to the recommendations given by SPEAG.

Compliance statement

The Siemens ISID tablet PC (FCC ID: LYHISID0001) is in compliance with the Federal Communications Commission (FCC) Guidelines [OET 65] for uncontrolled exposure.

The tablet PC was tested in the position, that results the highest SAR value in the following configurations:

For Antenna 2: Upper edge touching the phantom

For Antenna 3: Side edge touching the phantom

Bluetooth Antenna: Side edge touching the phantom

Maximum SAR_{1g} = 1.15 W/kg (802.11 a, Channel 64, Antenna 3)

1 Subject of Investigation

The ISID is a service and operation tool intended for the use in the shop-floor level. The ISID device is a tablet PC from Siemens operating in the 2.4 GHz and 5.0 GHz frequency range. The device has integrated antennas (1 x Bluetooth and 3 x WLAN) and the system concepts used are the Bluetooth (lesswire module, FCC ID: LYHBTCOMB01) and IEEE 802.11 a/b/g/n (INTEL module, FCC ID: PD94965AAGN) standards.

Fig. 1: Picture of the device under test .

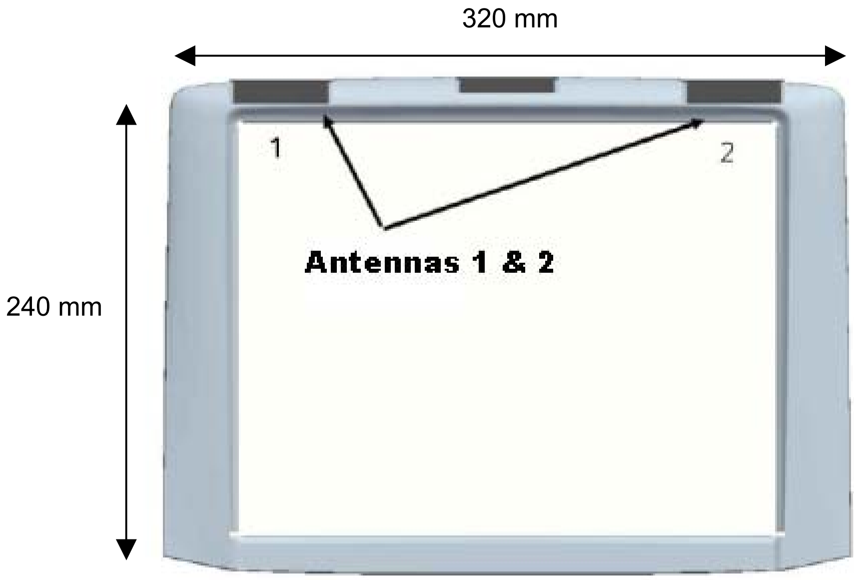

Fig. 2: Antenna positions, front view (WLAN antenna 1: only RX, WLAN antenna 2: RX and TX).

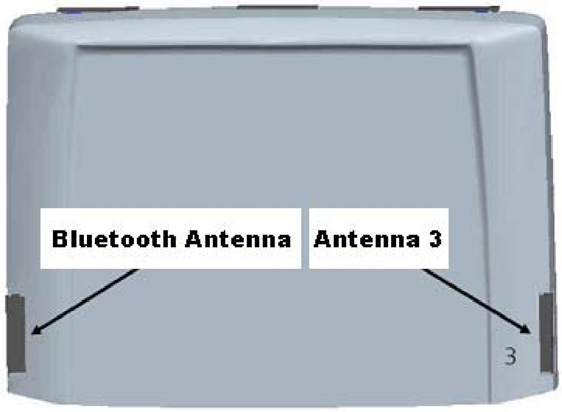

Fig. 3: Antenna positions, back view (Bluetooth antenna: RX and TX, WLAN antenna 3: RX and TX).

As stated by the manufacturer the hardware and software of the ISID production units are limited to following 802.11 modes and duty factors, therefore a scaling up to 100 % duty factor for the measured modes is not required:

- 801.11 b: 2412 MHz – 2462 MHz: (duty cycle: 98%)
- 801.11 g: 2412 MHz – 2462 MHz: (duty cycle: 91%)
- 802.11 n: 2412 MHz – 2462 MHz, 20 MHz: (duty cycle: 30%)
- 802.11 a: 5180 MHz – 5320 MHz: (duty cycle: 91%)
  5745 MHz – 5825 MHz: (duty cycle: 91%)
- 802.11 n: 5180 MHz – 5320 MHz, 20 MHz: (duty cycle: 30%)
  5190 MHz – 5310 MHz, 40 MHz: (duty cycle: 30%)
  5745 MHz – 5825 MHz, 20 MHz: (duty cycle: 24%)
  5755 MHz – 5795 MHz, 40 MHz: (duty cycle: 24%)

Mode 802.11	Channel	Frequency [MHz]	Modulation	Data Rate	Power [dBm]	
					Antenna 2	Antenna 3
b	1	2412	DPSK	1 Mbps	19.07	18.73
	6	2437			19.24	18.88

Table 2: WLAN settings for IEEE 802.11 a/n.

The objective of the measurements done by IMST was the dosimetric assessment of one device in body worn configuration in the Bluetooth and WLAN standards. The device was tested in the worst case positions with the housing of the tablet PC in direct contact against the flat phantom. The examinations have been carried out with the dosimetric assessment system „DASY4“ describes below.

2 The IEEE Standard C95.1 and the FCC Exposure Criteria

In the USA the FCC exposure criteria [OET 65] are based on the withdrawn IEEE Standard C95.1-1999 [IEEE C95.1-1999]. This version was replaced by the IEEE Standard C95.1-2005 [IEEE C95.1-2005] in October, 2005.

Both IEEE standards sets limits for human exposure to radio frequency electromagnetic fields in the frequency range 3 kHz to 300 GHz. One of the major differences in the newly revised C95.1-2005 is the change in the basic restrictions for localized exposure, from 1.6 W/kg averaged over 1 g tissue to 2.0 W/kg averaged over 10 g tissue, which is now identical to the ICNIRP guidelines [ICNIRP 1998].

2.1 Distinction Between Exposed Population, Duration of Exposure and Frequencies

The American Standard [IEEE C95.1-1999] distinguishes between controlled and uncontrolled environment. Controlled environments are locations where there is exposure that may be incurred by persons who are aware of the potential for exposure as a concomitant of employment or by other cognizant persons. Uncontrolled environments are locations where there is the exposure of individuals who have no knowledge or control of their exposure. The exposures may occur in living quarters or workplaces. For exposure in controlled environments higher field strengths are admissible. In addition the duration of exposure is considered.

Due to the influence of frequency on important parameters, as the penetration depth of the electromagnetic fields into the human body and the absorption capability of different tissues, the limits in general vary with frequency.

2.2 Distinction between Maximum Permissible Exposure and SAR Limits

The biological relevant parameter describing the effects of electromagnetic fields in the frequency range of interest is the specific absorption rate SAR (dimension: power/mass). It is a measure of the power absorbed per unit mass. The SAR may be spatially averaged over the total mass of an exposed body or its parts. The SAR is calculated from the r.m.s. electric field strength E inside the human body, the conductivity σ and the mass density ρ of the biological tissue:

$$SAR = \sigma \frac{E^2}{\rho} = c \frac{\partial T}{\partial t}\bigg|_{t \to 0+} . \qquad (1)$$

The specific absorption rate describes the initial rate of temperature rise $\partial T / \partial t$ as a function of the specific heat capacity *c* of the tissue. A limitation of the specific absorption rate prevents an excessive heating of the human body by electromagnetic energy.

As it is sometimes difficult to determine the SAR directly by measurement (e.g. whole body averaged SAR), the standard specifies more readily measurable maximum permissible exposures in terms of external electric *E* and magnetic field strength *H* and power density *S*, derived from the SAR limits. The limits for *E*, *H* and *S* have been fixed so that even under worst case conditions, the limits for the specific absorption rate SAR are not exceeded.

For the relevant frequency range the maximum permissible exposure may be exceeded if the exposure can be shown by appropriate techniques to produce SAR values below the corresponding limits.

2.3 SAR Limit

In this report the comparison between the American exposure limits and the measured data is made using the spatial peak SAR; the power level of the device under test guarantees that the whole body averaged SAR is not exceeded.

Having in mind a worst case consideration, the SAR limit is valid for uncontrolled environment and mobile respectively portable transmitters. According to Table 3 the SAR values have to be averaged over a mass of 1 g (SAR_{1g}) with the shape of a cube.

Standard	Status	SAR limit [W/kg]
IEEE C95.1-1999	Replaced	1.6

Table 3: Relevant spatial peak SAR limit averaged over a mass of 1 g.

3 The FCC Measurement Procedure

The Federal Communications Commission (FCC) has published a report and order on the 1st of August 1996 [FCC 96-326], which requires routine dosimetric assessment of mobile telecommunications devices, either by laboratory measurement techniques or by computational modeling, prior to equipment authorization or use. In 2001 the Commission's Office of Engineering and Technology has released Edition 01-01 of Supplement C to OET Bulletin 65. This revised edition, which replaces Edition 97-01, provides additional guidance and information for evaluating compliance of mobile and portable devices with FCC limits for human exposure to radiofrequency emissions [OET 65].

Since the measured device was only investigated in body worn configuration the required setups and information about measurements of devices which were operating next to a person´s ear (e.g handsets), were not covered within this documentation.

3.1 General Requirements

The test shall be performed in a laboratory with an environment which avoids influence on SAR measurements by ambient EM sources and any reflection from the environment itself. The ambient temperature shall be in the range of 20°C to 26°C and 30-70% humidity.

3.2 Phantom Requirements

For body-worn and other configurations a flat phantom shall be used which is comprised of material with electrical properties similar to the corresponding tissues.

3.3 Positioning of modules in Portable devices (PCMCIA Cards, USB Cards)

To use “Portable modules” in multiple notebooks, PCMCIA cards and similar integral-antenna packages has to be tested in three representative host products. According to Fig. 6 the device is tested in “lap-held” position with the bottom of the computer in direct contact against the flat phantom.

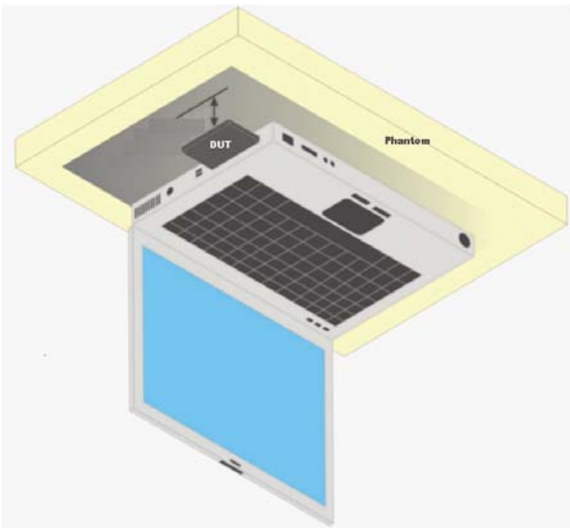

Fig. 4: Lap-held position, bottom of the computer is touching the phantom.

If the host product provides antennas within the screen antenna, the device should be measured with the screen touching the phantom

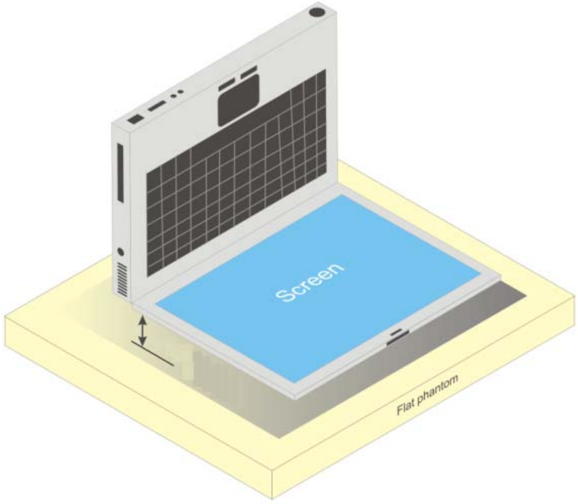

Fig. 5: Lap-held position, back of the screen is touching the phantom.

The typical measurement positions of a tablet PC are given below. For measurements of antennas which are mounted within the base of the PC, the base of the device is touching the phantom. Those antennas which are mounted within the edge of the PC were measured with the edge of the device touching the phantom.

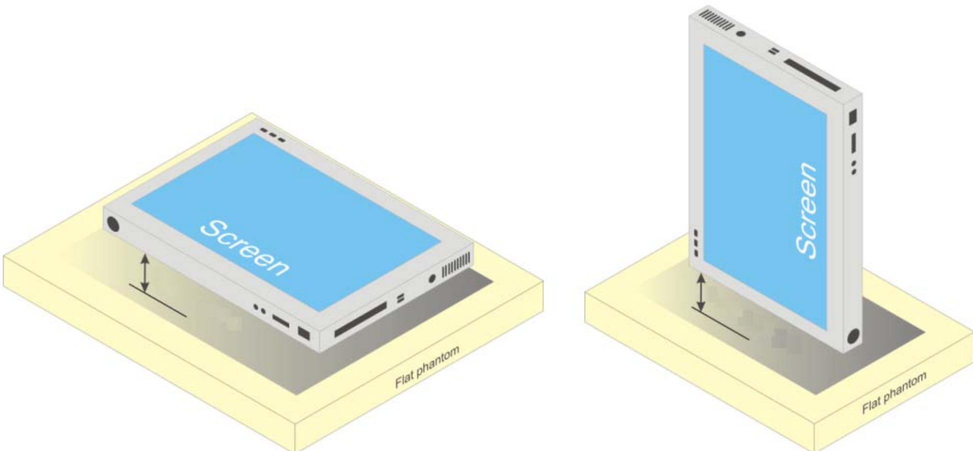

Fig. 6: Tablet PC, base and edge are touching the phantom.

3.4 Additional information for 802.11 a/b/g transmitters

In May 2007 the FCC published the revised issue of the SAR Measurement Procedures for 802 a/b/g transmitters to support the SAR measurements for demonstrating compliance with the FCC RF exposure guidelines. Additional information were required to establish specific device operating configurations to use during the measurements since the specific signal modulations, data rates, network conditions and other parameters were not considered within the current SAR measurement procedures (FCC, IEEE-1528).

Following the most important differences compared to the common SAR measurements of e.g. mobile phones working in the GSM or PCS standards were listed:

- Using of chipset based test mode software to ensure consistent and reliable results
- If the device supports switched diversity, the SAR should be measured with only one antenna transmitting (with fixed modulation and data rate) at a time
- The SAR is measured for the “default test channels” listed below as given by the FCC
- SAR measurements for 802.11 g channels when the maximum avg output power is less than ≥ 0.25 dB higher than the values for the corresponding 802.11b channels
- The avg. output power for 802.11a should be measured on all channels in each frequency band
- If the channel with the maximum avg. output power is not included in the default test channels, this channel should be tested instead of an adjacent default test channel
- For multiple channel bandwidth configurations, the configuration with the highest output power limit should be tested.
- Each channel should be tested at the lowest data rate in each a/b/g mode
- **When the extrapolated maximum peak SAR for the maximum output channel is ≤ 1.6 W/kg and the 1g avg SAR is ≤ 0.8 W/kg, testing of other channels in the default test channel configuration is optional.**
- If the device supports MIMO capability and the antennas are in close proximity to each other (within 3 cm – 5 cm), it is necessary to summarize the SAR_{1g} values of the antennas.
- If the peak SAR locations from different antennas are more than 5 cm apart, spatial summing is optional.
- Each channel should be tested at the lowest data rate in each a-b/g mode.

4 The Measurement System

DASY is an abbreviation of „Dosimetric Assessment System“ and describes a system that is able to determine the SAR distribution inside a phantom of a human being according to different standards. The DASY4 system consists of the following items as shown in Fig: 7. Additional Fig: 8 shows the equipment, similar to the installations in other laboratories.

- High precision robot with controller
- Measurement server (for surveillance of the robot operation and signal filtering)
- Data acquisition electronics DAE (for signal amplification and filtering)
- Field probes calibrated for use in liquids
- Electro-optical converter EOC (conversion from the optical into a digital signal)
- Light beam (improving of the absolute probe positioning accuracy)
- Two SAM phantoms filled with tissue simulating liquid
- DASY4 software
- SEMCAD

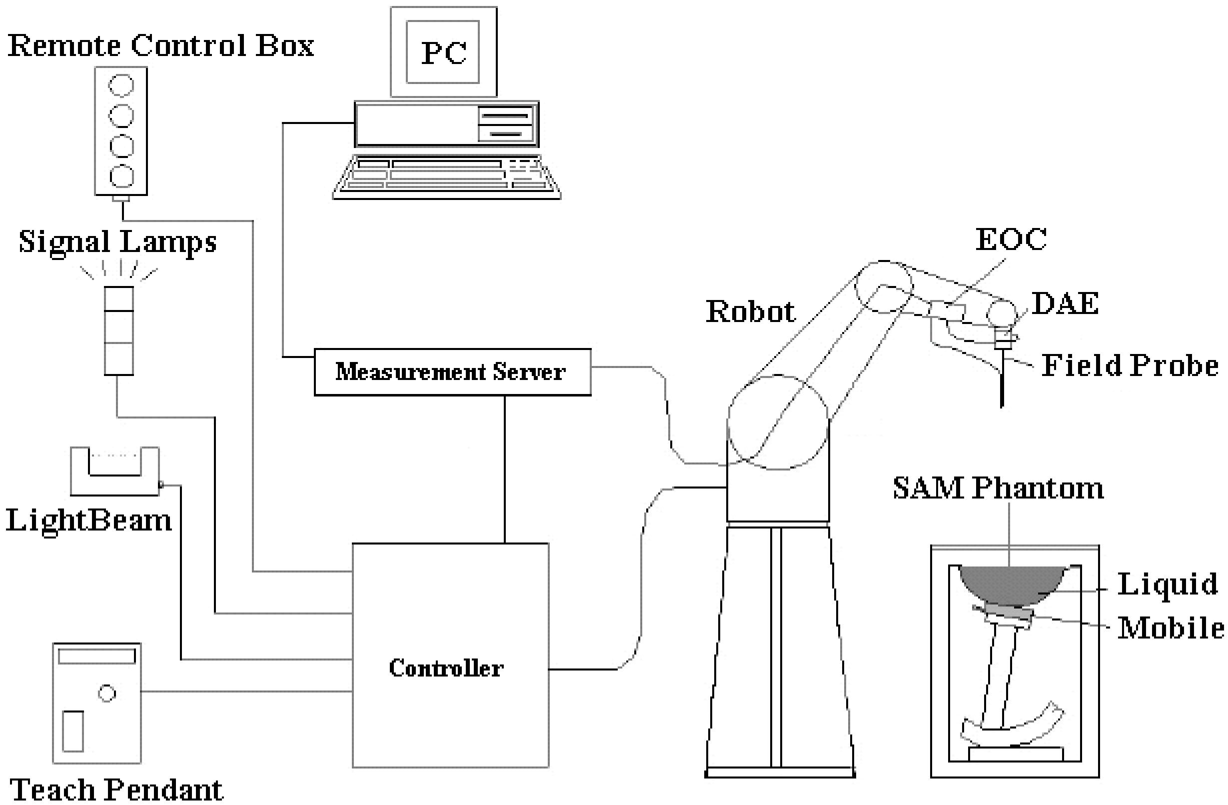

Fig. 7: The DASY4 measurement system.

Fig. 8: The measurement set-up with two SAM phantoms containing tissue simulating liquid.

The mobile phone operating at the maximum power level is placed by a non metallic device holder (delivered from Schmid & Partner) in the above described positions at a shell phantom of a human being. The distribution of the electric field strength *E* is measured in the tissue simulating liquid within the shell phantom. For this miniaturised field probes with high sensitivity and low field disturbance are used. Afterwards the corresponding SAR values are calculated with the known electrical conductivity σ and the mass density ρ of the tissue in the SEMCAD FDTD software. The software is able to determine the averaged SAR values (averaging region 1 g or 10 g) for compliance testing.

The measurements are done by two scans: first a coarse scan determines the region of the maximum SAR, afterwards the averaged SAR is measured in a second scan within the shape of a cube. The measurement time takes about 20 minutes.

4.1 Phantom

For the measurements the Specific Anthropomorphic Mannequin (SAM Twin Phantom V4.0) defined by the IEEE SCC-34/SC2 group and delivered by Schmid & Partner Engineering AG is used. The phantom is a fibreglass shell integrated in a wooden table. The thickness of the phantom amounts to 2 mm ± 0.2 mm. It enables the dosimetric evaluation of left and right hand phone usage and includes an additional flat phantom part for the simplified performance check. The phantom set-up includes a coverage (polyethylene), which prevents the evaporation of the liquid. The details and the Certificate of conformity can be found in Fig. 23.

4.2 Probe

For the measurements the Dosimetric E-Field Probes ET3DV6R or EX3DV4 with following specifications are used. They are manufactured and calibrated in accordance with FCC [OET 65] and IEEE [IEEE 1528-2003] recommendations annually by Schmid & Partner Engineering AG.

ET3DV6R:

- Dynamic range: 5µW/g to > 100mW/g
- Tip diameter: 6.8 mm
- Probe linearity: ± 0.2 dB (30 MHz to 3 GHz)
- Axial isotropy: ± 0.2 dB
- Spherical isotropy: ± 0.4 dB
- Distance from probe tip to dipole centers: 2.7 mm
- Calibration range: 900MHz / 1800MHz / 1900MHz / 1950 MHz / 2450MHz for head and body simulating liquid
- Angle between probe axis (evaluation axis) and surface normal line: less than 30°

EX3DV4:

- Dynamic range: 10µW/g to > 100mW/g (noise typically < 1µW/g)
- Tip diameter: 2.5 mm
- Probe linearity: ± 0.2 dB (30 MHz to 3 GHz)
- Axial isotropy: ± 0.2 dB
- Spherical isotropy: ± 0.4 dB
- Distance from probe tip to dipole centers: 1.0 mm
- Calibration range: 900MHz / 1800MHz / 1900MHz / 1950 MHz / 2450MHz/ 5 GHz for head and body simulating liquid
- Angle between probe axis (evaluation axis) and surface normal line: less than 30°

4.3 Measurement Procedure

The following steps are used for each test position:

- Establish the TX with the maximum output power with the integrated chipset based test mode software.
- Measurement of the local E-field value at a fixed location (P1). This value serves as a reference value for calculating a possible power drift.
- Measurement of the SAR distribution with a grid spacing of 10 mm x 10 mm and a constant distance to the inner surface of the phantom. Since the sensors can not directly measure at the inner phantom surface, the values between the sensors and the inner phantom surface are extrapolated. With this values the area of the maximum SAR is calculated by a interpolation scheme (combination of a least-square fitted function and a weighted average method). Additional all peaks within 2 dB of the maximum SAR are searched.
- Around these points, a cube with the dimensions dx = 4.3 mm, dy = 4.3 mm, dz = 3 mm is assessed by measuring 8 x 8 x 8 points. With these data, the peak spatial-average SAR value can be calculated within the SEMCAD software.
- The used extrapolation and interpolation routines are all based on the modified Quadratic Shepard´s method [DASY4].
- Repetition of the E-field measurement at the fixed location (P1) and repetition of the whole procedure if the two results differ by more than ± 0.21dB.

4.4 Uncertainty Assessment

Table 5 includes the worst case uncertainty budget determined by Schmid & Partner Engineering AG for the frequency range up to 6 GHz. The expanded uncertainty (K=2) is assessed to be ± 25.9 %.

Error Sources	Uncertainty Value	Probability Distribution	Divisor	c_i	Standard Uncertainty	v_i^2 or v_{eff}

5 SAR Results

As stated by the manufacturer the hardware and software of the ISID production units are limited to following modes and duty factors, therefore a scaling up to 100 % duty factor for the measured modes is not required:

- 801.11 b: 2412 MHz – 2462 MHz: (duty cycle: 98%)
- 801.11 g: 2412 MHz – 2462 MHz: (duty cycle: 91%)
- 802.11 n: 2412 MHz – 2462 MHz, 20 MHz: (duty cycle: 30%)
- 802.11 a: 5180 MHz – 5320 MHz: (duty cycle: 91%)

  5745 MHz – 5825 MHz: (duty cycle: 91%)
- 802.11 n: 5180 MHz – 5320 MHz, 20 MHz: (duty cycle: 30%)

  5190 MHz – 5310 MHz, 40 MHz: (duty cycle: 30%)

  5745 MHz – 5825 MHz, 20 MHz: (duty cycle: 24%)

  5755 MHz – 5795 MHz, 40 MHz: (duty cycle: 24%)

Since the different antennas and there peak SAR locations are more than 5 cm apart, the SAR 1g values are evaluated independently. For each antenna the worst case of the following positions were investigated: bottom of tablet touching the phantom, upper edge touching the phantom, side edge touching the phantom.

The Tables below contain the worst case measured SAR values averaged over a mass of 1 g.

Mode: Bluetooth	Duty cycle: 76.4%	Crest Factor: 1.3	Antenna: Bluetooth	
Position: Side edge touching the phantom				
SAR_{1g} [W/kg] (Drift[dB])			Temperature	
Channel 1 2402 MHz 14.77 dBm	Channel 39 2441 MHz 15.07 dBm	Channel 78 2480 MHz 14.93 dBm	Ambient [° C]	Liquid [° C]

Table 24: Measurement results for 802.11 n for the Siemens ISID (* Max Cube) .

The "* Max Cube" labeling indicates that during the grid scanning an additional peak was found which was within 2.0 dB of the highest peak. The value of the highest cube is given in the tables above, the value from the second assessed cube is given in the SAR distribution plots (see appendix).

The above mentioned power values are "conducted" power values. The values were delivered by 7layers AG, Ratingen.

To control the output power stability during the SAR test the used DASY4 system calculates the power drift by measuring the e-field at the same location at the beginning and at the end of the measurement for each test position. These drift values can be found in the above tables labeled as: (Drift[dB]). This ensures that the power drift during one measurement is within 5%.

6 Evaluation

In Fig. 9 - 13 the head phantom SAR results for Bluetooth and the IEEE 802.11 a/b/g/n standards given in Table 6 - 24 are summarized and compared to the limit.

Since the different antennas and their peak SAR locations are more than 5 cm apart, the SAR_{1g} values are evaluated independently.

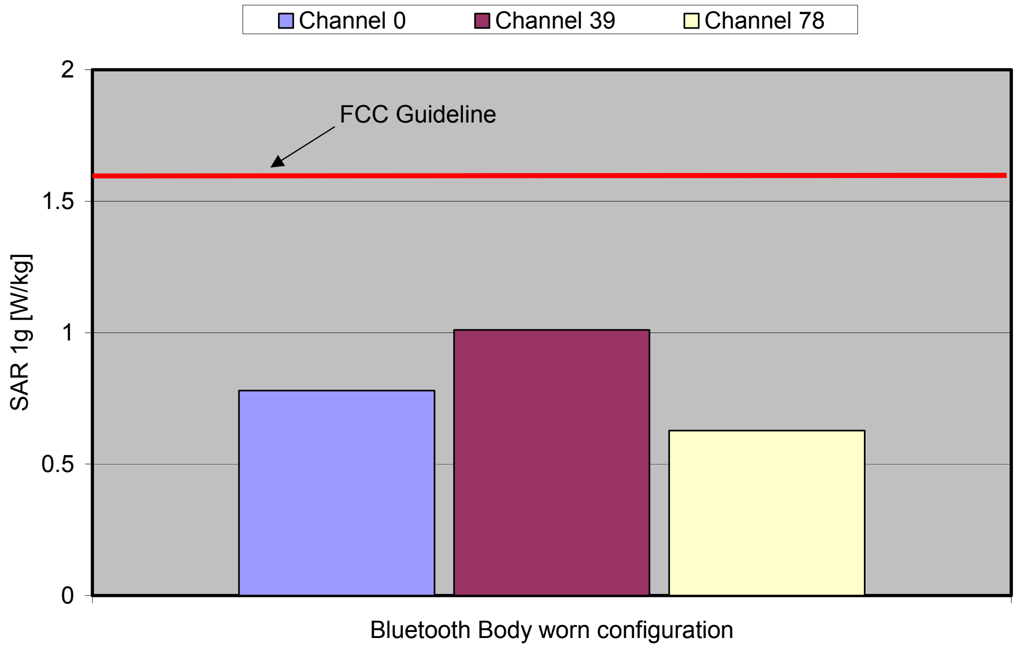

Fig. 9: The measured SAR values for the Siemens ISID for Bluetooth in comparison to the FCC exposure limit.

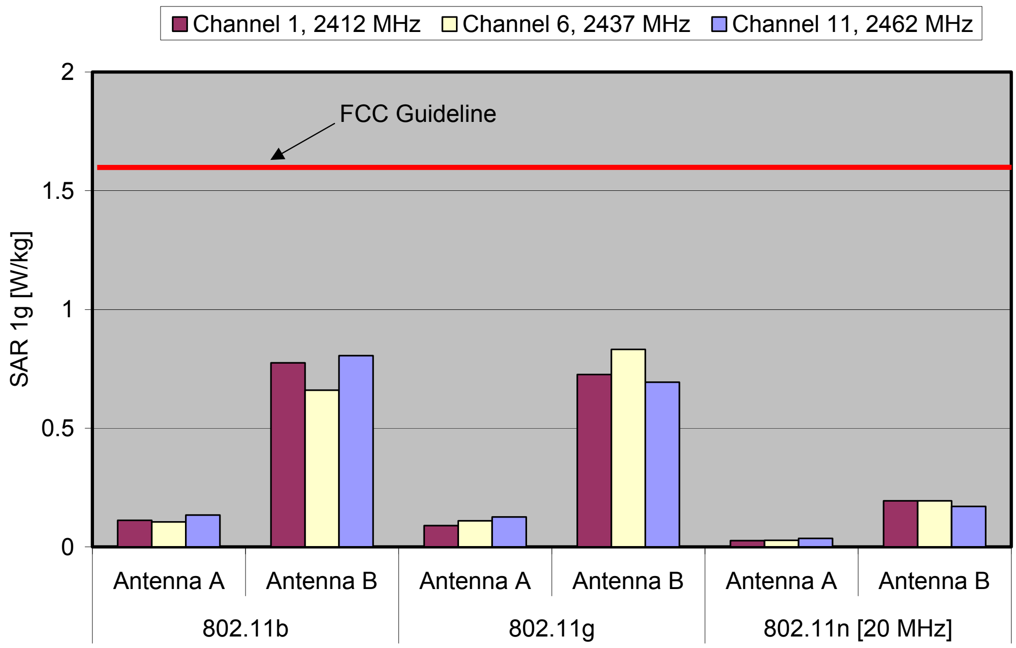

Fig. 10: The measured SAR values for the Siemens ISID for 802.11b/g/n[20MHz] in comparison to the FCC exposure limit.

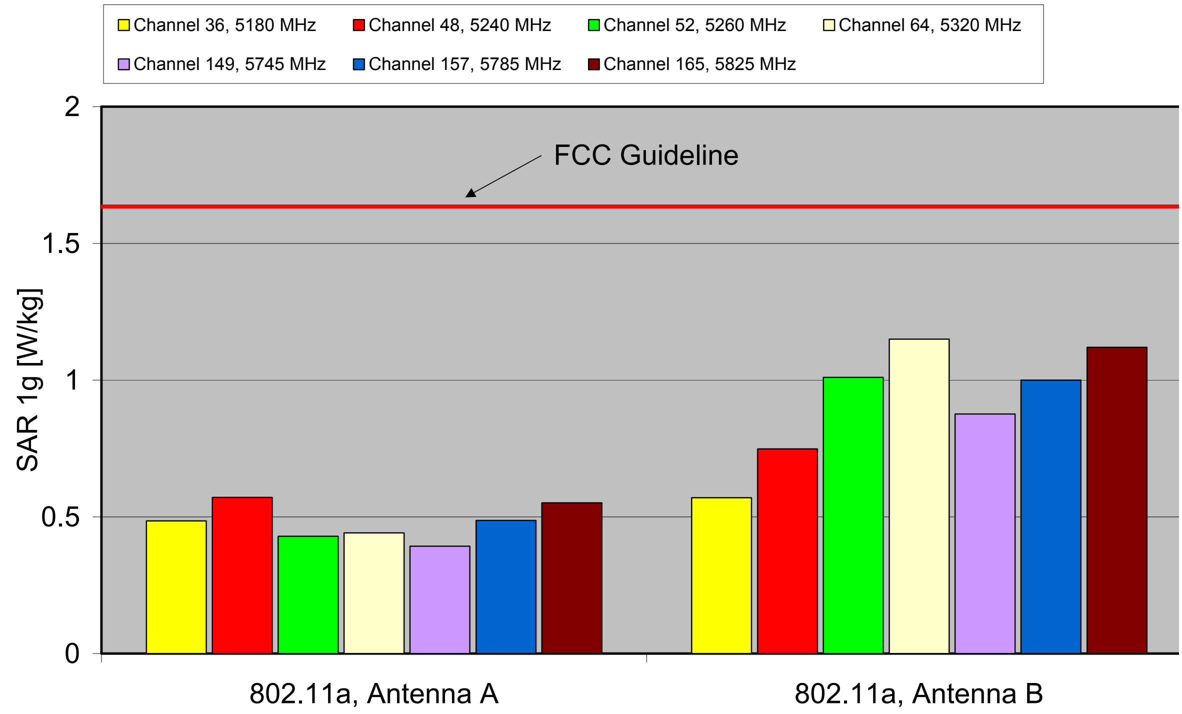

Fig. 11: The measured SAR values for the Siemens ISID for 802.11a in comparison to the FCC exposure limit.

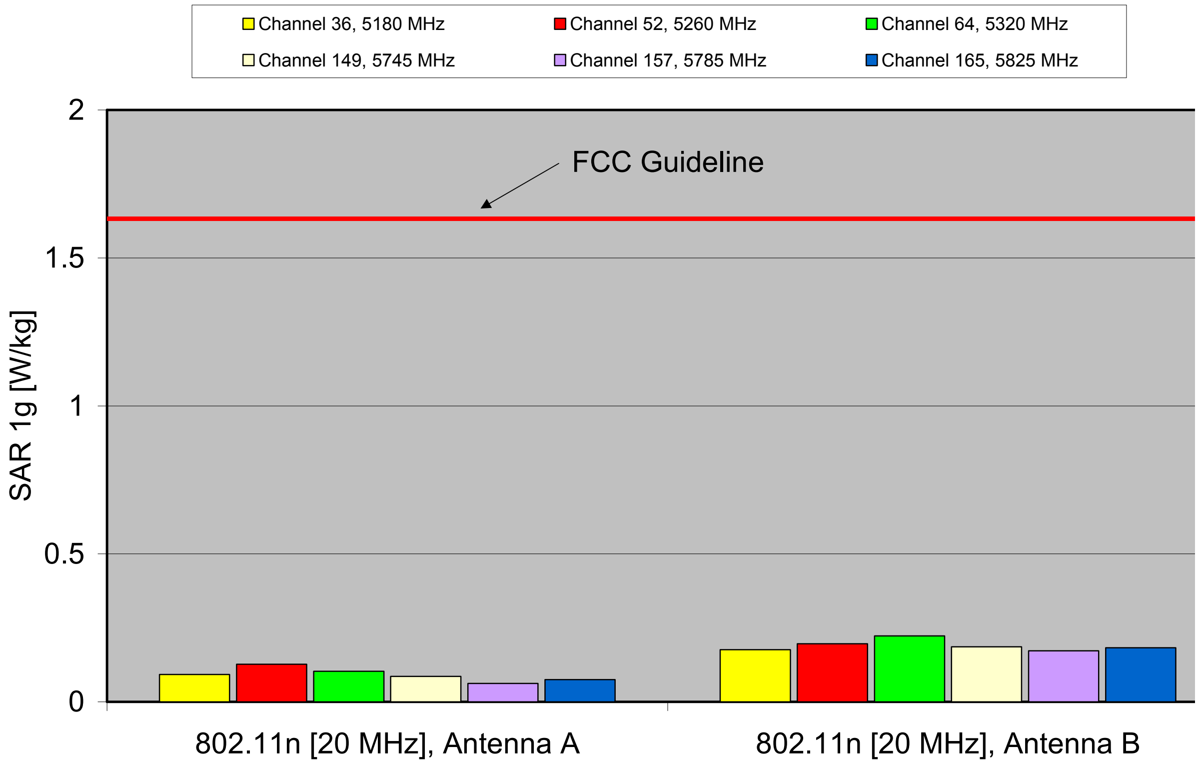

Fig. 12: The measured SAR values for the Siemens ISID for 802.11n[20MHz] in comparison to the FCC exposure limit.

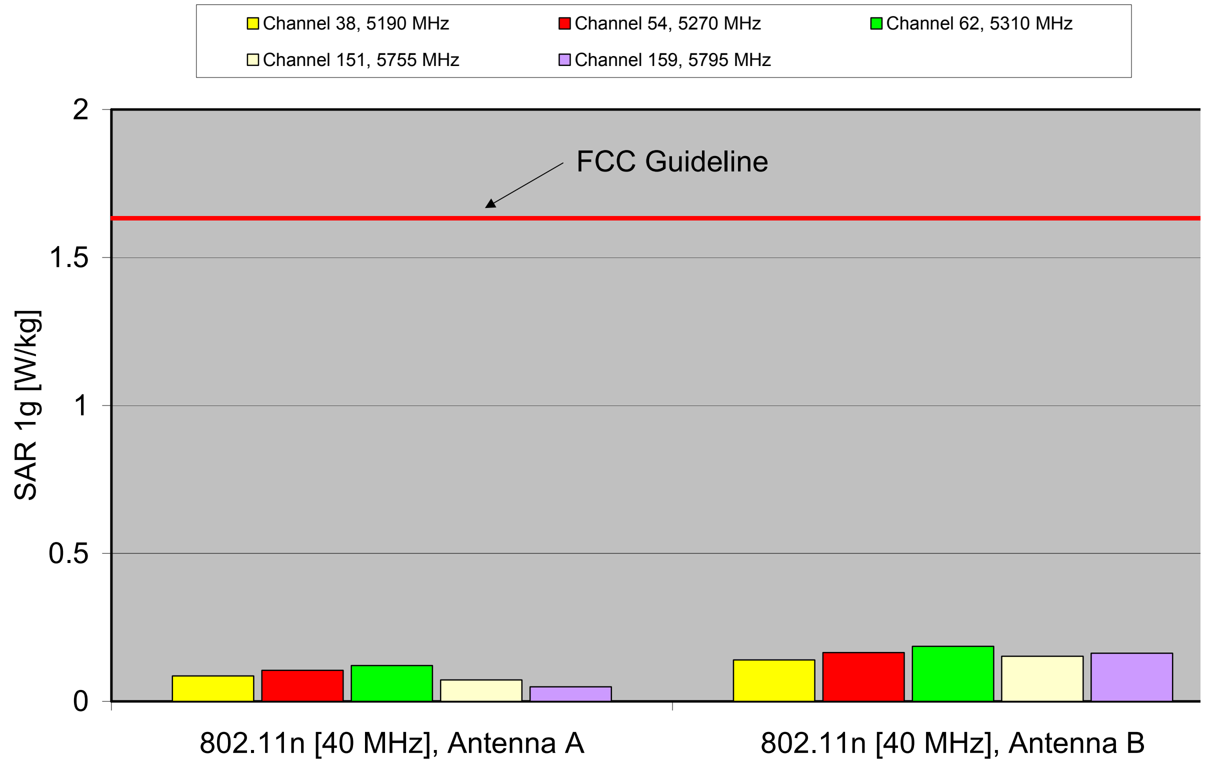

Fig. 13: The measured SAR values for the Siemens ISID for 802.11n[40MHz] in comparison to the FCC exposure limit.

The Siemens ISID tablet PC (FCC ID: LYHISID0001) is in compliance with the Federal Communications Commission (FCC) Guidelines [OET 65] for uncontrolled exposure.

The tablet PC was tested in the position, that results the highest SAR value in the following configurations:

For Antenna 2: Upper edge touching the phantom

For Antenna 3: Side edge touching the phantom

Bluetooth Antenna: Side edge touching the phantom

7.2 Device under Test and Test Conditions

MTE:	Siemens ISID (tablet PC), identical prototype
Date of receipt:	August 03, 2007
SN:	01120d02
FCC ID (Siemens ISID):	LYHISID0001
Equipment class:	Portable device
Integrated Bluetooth module:	lesswire, FCC ID: LYHBTCOMB01
Integrated WLAN module:	INTEL, FCC ID: PD94965AGN
RF exposure environment:	General Population/Uncontrolled
Power supply:	Internal battery
Antenna:	Antenna Type: integrated
Measured Standards:	IEEE 802.11 a/b/g/n
Method to establish a call:	Test mode software
Used Phantom:	SAM Twin Phantom V4.0, as defined by the IEEE SCC-34/SC2 group and delivered by Schmid & Partner Engineering AG

Siemens ISID	RX/TX Range [MHz]	Used Channels [low, middle, high]	Used Crest Factor
2450 MHz Bluetooth	2402 – 2480	0, 39, 78	1.3
2450 MHz b-mode	2412 – 2462	1, 6, 11	1
2450 MHz g-mode	2412 – 2462	1, 6, 11	1.1
2450 MHz n-mode [20MHz]	2412 – 2462	1, 6, 11	3.3
5200 MHz a-mode	5180 – 5320	36, 48, 52, 64	1.1
5800 MHz a-mode	5745 – 5825	149, 157, 165	1.1
5200 MHz n-mode [20 MHz]	5180 – 5320	36, 52, 64	3.3
5200 MHz n-mode [40 MHz]	5190 – 5310	38, 54, 62	4.2
5800 MHz n-mode [20 MHz]	5745 – 5825	149, 157, 165	3.3
5800 MHz n-Mode [40 MHz]	5755 – 5795	151, 159	4.2

7.3 Tissue Recipes

The following recipes are provided in percentage by weight.

2450 MHz, Body:	31.40%	Diethylenglykol-monobutylether
	68.60%	De-Ionized Water

The tissue simulating liquids for the frequency range from 3.5 GHz up to 5.8 GHz were delivered by SPEAG, therefore the detailed compositions are not available and only the included ingredients were listed and shown in Fig. 33.

3500 MHz – 5800 MHz, Head / Body:	11 % - 36 %	Mineral Oil
	0.5 % - 15 %	Emulsifiers
	60 % - 78 %	Water
	0.4 % - 3 %	Additives and salt

7.4 Material Parameters

For the measurement of the following validation and measurement parameters the HP 85070B dielectric probe kit is used, representing the open-ended coaxial probe measurement procedure. The measured values should be within ± 5% of the recommended values given by the FCC.

Material Parameters, Used for SAR Dipole Validation			
Frequency		ε_r	σ [S/m]
2450 MHz Body (Bluetooth, August 23, 2007)	Recommended Value	52.70 ± 2.63	1.95 ± 0.09
	Measured Value	51.90	1.96
2450 MHz Body (b-mode, August 14, 2007)	Recommended Value	52.70 ± 2.63	1.95 ± 0.09
	Measured Value	53.20	1.97
2450 MHz Body (g-mode, August 20, 2007)	Recommended Value	52.70 ± 2.63	1.95 ± 0.09
	Measured Value	51.20	1.88
2450 MHz Body (n-mode, August 16, 2007)	Recommended Value	52.70 ± 2.63	1.95 ± 0.09
	Measured Value	50.9	1.96
5200 MHz Body (a-mode, August 03, 2007)	Recommended Value	49.00 ± 2.40	5.30 ± 0.26
	Measured Value	48.20	5.43
5200 MHz Body (n-mode, August 08, 2007)	Recommended Value	49.00 ± 2.40	5.30 ± 0.26
	Measured Value	50.00	5.44
5800MHz Body (a-mode, August 06, 2007)	Recommended Value	48.20 ± 2.40	6.00 ± 0.30
	Measured Value	47.30	6.07
5800 MHz Body (n-mode, August 07, 2007)	Recommended Value	48.20 ± 2.40	6.00 ± 0.30
	Measured Value	47.00	6.20

Table 25: Parameters of the tissue simulating liquid for the dipole validation.

Material Parameters, Used for SAR Measurements, 2 GHz			
Frequency of Validation	**Recommended / Measured Values**	**ε_r**	**σ [S/m]**

Table 27: Parameters of the tissue simulating liquid for the SAR measurements, 5 GHz.

7.5 Simplified Performance Checking

The simplified performance check was realized using the dipole validation kits. The input power of the dipole antennas were 250 mW and they were placed under the flat part of the SAM phantoms. The target and measured results are listed in the Table 28 - 29 and shown in Fig. 14 - 21. The target values were adopted from the manufactures calibration certificates.

Available Dipoles		SAR_{1g} [W/kg]	ε_r	σ [S/m]
D2450V2, SN #709	Target Values Body	13.40	51.20	1.96
D5GHzV2, 5.2 GHz, SN #1028		19.40	47.40	5.28
D5GHzV2, 5.5 GHz, SN #1028		19.70	46.80	5.68
D5GHzV2, 5.8 GHz, SN #1028		17.90	46.20	6.07

Table 28: Dipole target results.

Used Dipoles		SAR_{1g} [W/kg]	ε_r	σ [S/m]
2450 MHz Body (Bluetooth, August 23, 2007)	Measured Values Body	13.90	51.90	1.96
2450 MHz Body (b-mode, August 14, 2007)		13.70	53.20	1.97
2450 MHz Body (g-mode, August 20, 2007)		12.90	51.20	1.88
2450 MHz Body (n-mode, August 16, 2007)		14.10	50.90	1.96
5200 MHz Body (a-mode, August 03, 2007)		20.50	48.20	5.43
5200 MHz Body (n-mode, August 08, 2007)		20.60	50.00	5.44
5800MHz Body (a-mode, August 06, 2007)		18.80	47.30	6.07
5800 MHz Body (n-mode, August 07, 2007)		19.00	47.00	6.20

Conformity

We certify that this **system is designed to be fully compliant** with the standards [1 – 6] for RF emission tests of wireless devices.

Uncertainty

The uncertainty of the measurements with this system was evaluated according to the above standards and is documented in the applicable chapters of the DASY4 system handbook.
The uncertainty values represent current state of methodology and are subject to changes. They are applicable to all laboratories using DASY4 provided the following requirements are met (responsibility of the system end user):

1) the system is used by an experienced engineer who follows the manual and the guidelines taught during the training provided by SPEAG,
2) the probe and validation dipoles have been calibrated for the relevant frequency bands and media within the requested period,
3) the DAE has been calibrated within the requested period,
4) the "minimum distance" between probe sensor and inner phantom shell and the radiation source is selected properly,
5) the system performance check has been successful,
6) the operational mode of the DUT is CW, CDMA, FDMA or TDMA (GSM, DCS, PCS, IS136, PDC) and the measurement/integration time per point is ≥ 500 ms,
7) the dielectric parameters of the liquid are conformant with the standard requirement,
8) the DUT has been positioned as described in the manual.
9) the uncertainty values from the calibration certificates, and the laboratory and measurement equipment dependent uncertainties, are updated by end user accordingly.

Certificate of conformity / First Article Inspection

Item	SAM Twin Phantom V4.0
Type No	QD 000 P40 BA
Series No	TP-1002 and higher
Manufacturer / Origin	Untersee Composites Hauptstr. 69 CH-8559 Fruthwilen Switzerland

Tests

The series production process used allows the limitation to test of first articles.
Complete tests were made on the pre-series Type No. QD 000 P40 AA, Serial No. TP-1001 and on the series first article Type No. QD 000 P40 BA, Serial No. TP-1006. Certain parameters have been retested using further series units (called samples).

Test	Requirement	Details	Units tested
Shape	Compliance with the geometry according to the CAD model.	IT'IS CAD File (*)	First article, Samples
Material thickness	Compliant with the requirements according to the standards	2mm +/- 0.2mm in specific areas	First article, Samples
Material parameters	Dielectric parameters for required frequencies	200 MHz – 3 GHz Relative permittivity < 5 Loss tangent < 0.05.	Material sample TP 104-5
Material resistivity	The material has been tested to be compatible with the liquids defined in the standards	Liquid type HSL 1800 and others according to the standard.	Pre-series, First article

Standards

[1] CENELEC EN 50361
[2] IEEE P1528-200x draft 6.5
[3] IEC PT 62209 draft 0.9
(*) The IT'IS CAD file is derived from [2] and is also within the tolerance requirements of the shapes of [1] and [3].

Conformity

Based on the sample tests above, we certify that this item is in compliance with the uncertainty requirements of SAR measurements specified in standard [1] and draft standards [2] and [3].

Use of the substance:
Liquid simulating physical parameters of Head or Muscle Tissue in the RF range to 6GHz.

2 Composition / Information on ingredients

The Item is composed of the following ingredients:

Water	64 - 78%
Mineral Oil	11 - 18%
Emulsifiers	9 - 15%
Additives and Salt	2 - 3%

Safety relevant ingredients according to EU directives:

CAS-No 107-41-5	< 4%	2-Methyl-2,4-pentandiol (Hexylene Glycol): Xi irritant, R36/38 irritant for eyes and skin
CAS-No 770-35-4	< 2%	1-Phenoxy-2-propanol (Propylene Glycol Phenyl Ether): Xi irritant, R36 irritant for eyes
CAS-No 93-83-4	< 2%	N,N-bis(2-Hydroxyethyl)oleamide: Xi irritant, R36/38 irritant for eyes and skin
CAS-No 9004-95-9	< 0.5%	Polyethylene glycol cetyl ether: Xi irritant, R22 harmful if swallowed, R36/38 irritant for eyes and skin R50 Very toxic to aquatic organisms

According to EU guidelines and Swiss rules, the product is not a dangerous mixture and therefore not required to be marked by symbols.

3 Hazards identification

Identification not required.

4 First aid measures

The product reacts slightly alkaline.

After skin contact:	Wash with fresh water and mild sope
After eye contact:	Rinse out with plenty of water for several minutes with the eyelid held open. Consult an ophthalmologist if necessary.
After ingestion:	Do not induce vomiting. Get medical attention.

5 Fire-fighting measures

Firefighting media	CO2, foam, dry chemical
Combustion products	Carbon oxides, nitrogen and traces of oxides of chlorine and sulfur, HCl

Due to the high water content, the liquid is self-extinguishing.

6 Accidental release measures

Person-related precaution measures: wash with water and mild soap.
Environmental-protection measures: do not allow to enter sewerage system.
Procedures for cleaning / absorption: Use oil-binding agents., forward for disposal. Spills may cause slippery conditions.

7 Handling and storage

Handling: Keep in open container only for minimum required time in order to avoid water evaporation.
Storage: tightly closed, between >0 to 40°C. Avoid direct solar irradiation of the storage containers.

8 Exposure controls / personal protection

Protection measures are not generally required. For eye protection, industrial safety glasses are recommended. Personal hygiene and clean working practices are sufficient.

9 Physical and chemical properties

Form:	liquid
Colour:	medium to dark brown, transparent to opaque
Odour:	almost odourless / slightly oily
pH-Value:	slightly alcalic
Boiling point:	100°C
Density:	1g/cm^3

10 Stability and reactivity

Conditions to be avoided: heating above 40°C
The product contains water and is not compatible with strong oxidizers or magnesium.

11 Toxicological information

LD50 > 40 g/kg
Further data: the product should be handled with the care usual when dealing with chemicals

12 Ecological information

Contains mineral oil. Do not allow to enter waters, waste water, or soil!

13 Disposal considerations

Disposal is possible by splitting the mineral oil from the emulsion with absorbing agents, with salt or ultra-filtration. Dispose as other mineral oil containing products according to local regulations.
Product packing must be disposed of in compliance with respect national regulations.

14 Transport information

Not subject to transport regulations.

15 Regulatory information

No special labelling required.

16 Other information

Release date:	6.1.2005
Responsible:	FB
