ANAB

Compliance Testing, LLC, has been accredited in accordance with the recognized International Standard ISO/IEC 17025:2017. This accreditation demonstrates technical competence for a defined scope and the operation of a laboratory quality management system (refer to the joint ISO-ILAC-IAF Communiqué dated January 2009).

The tests results contained within this test report all fall within our scope of accreditation, unless noted below.

Please refer to <http://www.compliancetesting.com/labscope.html> for current scope of accreditation.

Testing Certificate Number: **2152.01**

FCC Site Reg. #349717

IC Site Reg. #2044A-2

Test and Measurement Data

All tests and measurement data shown were performed in accordance with FCC Rules and Regulations, Volume II, Part 2, Subpart J, Sections 2.947, 2.1033(c), 2.1041, 2.1046, 2.1047, 2.1049, 2.1051, 2.1053, 2.1055, 2.1057, and the following individual Parts: FCC Part 74.

Standard Test Conditions and Engineering Practices

Except as noted herein, the following conditions and procedures were observed during the testing.

In accordance with ANSI/TIA 603C, and unless otherwise indicated in the specific measurement results, the ambient temperature of the actual EUT was maintained within the range of 10° to 40°C (50° to 104°F) unless the particular equipment requirements specified testing over a different temperature range. Also, unless otherwise indicated, the humidity levels were in the range of 10% to 90% relative humidity.

Environmental Conditions		
Temp (°C)	Humidity (%)	Pressure (mbar)
24.8 – 29.6	12 – 26	963.1 – 964.9

Measurement results, unless otherwise noted, are worst-case measurements.

EUT Description

Model: EC 704MP, Exact V2 Exciter

Description: Broadcast Transmitter

Additional Information:

The EC-704MP digital transmitter system is an up to 350W average power (when using ATSC 1.0 8VSB modulation), 300W average power (when using ATSC 3.0 COFDM modulation) that consists of a Hitachi Kokusai Electric Comark Exact V2 digital exciter, Hitachi Kokusai Electric Linear CM-8001 Drive controller, one (1) GV40010 Amplifier, a passive hybrid combining system, a 40243 Low pass filter, and a Com-Tech FC6D60C 6 Pole Mask Filter (or equivalent or more stringent filter). This system is used to provide an ATSC 1.0 or ATSC 3.0 modulated signal over the UHF channels 14 through 36 in a manner consistent with FCC Part 74.

EUT Operation during Tests

Conducted RF measurements were recorded after the 6 pole mask filter, via a RF coupler attached to the filter output. The coupler thru port was connected to a 10000 watt 50 ohm load.

The EUT has 2 types of modulation, ATSC1.0 (8VSB) and ATSC 3.0 (OFDM).

The system was tested with the manufacturer supplied Stringent Mask filter was tuned to 491 MHz (CH 14).

All tests were performed with the tuned frequency set to 491 MHz.

AC power is 230 VAC at 60 Hz.

74.794(b)(4) 2.1055	Frequency Stability (Voltage Variation)	Pass	

Statements of conformity are reported as:

- Pass - the measured value is below the acceptance limit, *acceptance limit = test limit*.
- Fail - the measured value is above the acceptance limit, *acceptance limit = test limit*.

Power Limitations (Output Power)

Engineer: Greg Corbin

Test Date: 10/1/2020

Measurement Procedure

The Equipment Under Test (EUT) was connected to a spectrum analyzer through a 37 dB Precision RF coupler. All cable and coupler losses were input into the spectrum analyzer as a reference level offset to ensure accurate readings were obtained.

The channel power measurement tool on the spectrum analyzer was used to record the output power.

Output power for both modulations (ATSC 1.0 and ATSC 3.0) were recorded.

Test Setup

High Power Transmitter Peak Output Power

Modulation	Tuned Frequency (MHz)	Recorded Measurement (watt)	Limit (watt)	Result
ATSC 1.0	491	351.3	15000	Pass
ATSC 3.0	491	300.3	15000	Pass

Output Power_ATSC 1.0 modulation

Output Power_ATSC 3.0 modulation

Emission Mask

Engineer: Greg Corbin

Test Date: 10/1/2020

Measurement Procedure

The EUT was connected as shown in the Test Set-up below.

The EUT uses a stringent mask filter.

The EUT was set to maximum power and the Out of Band emissions were recorded using the stringent mask limit per FCC Part 74.794(a)(ii).

The Out of Band emissions were recorded for modulations (ATSC 1.0 and ATSC 3.0).

RBW = 510 kHz

VBW = 1.5 MHz

Emission Mask_ ATSC 1.0

Emission Mask_ ATSC 3.0

Occupied Bandwidth

Engineer: Greg Corbin

Test Date: 10/1/2020

Measurement Procedure

The EUT was connected as shown in the Test Set-up below.
The EUT was set to maximum power and the Occupied Bandwidth was recorded using the spectrum analyzer occupied bandwidth tool.

The occupied bandwidth was recorded for both modulations (ATSC 1.0 and ATSC 3.0).

Test Setup

Occupied Bandwidth_ ATSC 1.0 modulation

Occupied Bandwidth_ ATSC 3.0 modulation

Conducted Spurious Emissions

Engineer: Greg Corbin

Test Date: 10/1/2020

Test Procedure

The EUT was setup as shown below.

For measurements above 1 GHz, a high pass filter was installed at the spectrum analyzer input.

Conducted spurious emissions from 30 MHz to the 10th harmonic of the fundamental transmitter were recorded and compared to the 75 dBc limit.

In addition, the GPS bands (1164 – 1610 MHz) were measured separately and compared to the 85 dBc limit.

Conducted spurious emissions were recorded for ATSC 1.0 and ATSC 3.0 modulations.

RBW was set to 100 kHz for 30 – 1000 MHz and 1 MHz from 1 – 7 GHz.

Test Setup

Conducted Spurious Emissions Summary Test Table

Frequency Range	Modulation	fundamental Power	Spurious Frequency	Measured Spurious Level		Specification Limit	Margin
(MHz)	(N/A)	(dBm)	(MHz)	(dBm)	(dBc)	(dBc)	(dB)
30 - 1000	ATSC 1.0	55.44	292.26	-21.7	77.14	75	-2.14
30 - 1000	ATSC 3.0	54.77	292.79	-21.69	76.46	75	-1.46

Field Strength of Spurious Radiation

Engineer:

Test Date:

Test Procedure

The EUT was tested in a semi-anechoic chamber with the turntable set 3m from the receiving antenna.

The EUT output was terminated into 50 ohm non-radiating termination.

Spurious emissions were recorded for ATSC 1.0 and ATSC 3.0 modulations.

A spectrum analyzer was used to verify that the EUT met the requirements for radiated emissions.

The EUT was tested by rotating it 360 degrees with the antenna in both the vertical and horizontal orientation while raised from 1 to 4 meters to ensure that the signal levels were maximized.

The radiated spurious emissions were measured from 30 MHz to 7 GHz.

From 30 – 1000 MHz, the 3m chamber pre-amplifier was bypassed and a notch filter (tuned to 491 MHz) was used at the receive antenna output.

From 1 – 7 GHz, a high pass filter (cutoff freq = 1 GHz) was used at the receive antenna output.

All cable and antenna correction factors were input into the spectrum analyzer before recording spurious measurement.

RBW = 500 kHz

VBW = 1.5 MHz

A pre-scan was performed using a peak detector and then final measurements were performed using an average detector.

Per FCC part 74.735(b) the output power is referenced as ERP.

Using the formulas in C63.26-2015, Annex C, the transmit power in watts was converted to electric field strength in dBuV/m.

Convert power in watts to field strength in V/m using the following formula.

$$ERP = pt \times gt = (E \times d)^2 / 49.2$$

$$E = (\sqrt{pt \times gt \times 49.2}) / d$$

pt = transmitter output power in watts

gt = transmitting antenna numeric gain (see note)

E = electric field strength in V/m

d = measurement distance in meters

Note: The transmitter is not marketed with an antenna so the antenna gain = 0 dBi (numerical gain = 1)

Convert field strength in V/m to field strength in dBuV/m using the following formula.

$$E(\text{dBuV/m}) = 20 \times \text{LOG}(E)$$

Spurious Level (dBc) = Referenced Output Power (dBuV/m) – Spurious Level (dBuV/m)

Frequency Stability (Temperature Variation)

Engineer: Greg Corbin

Test Date: 10/6/2020

Measurement Procedure

The Exact V2 digital exciter contains the frequency determining electronics and was tested for frequency stability. The exciter was placed in an environmental test chamber and the RF output was connected directly to a spectrum analyzer.

The temperature was varied from 0°C to 40°C in 10°C increments.

After a sufficient time for temperature stabilization the RF output frequency was measured.

At 20°C the power supply voltage to the EUT was varied from 85% to 115% of the nominal value and the RF output frequency was measured.

Measurement Setup

Frequency Stability vs Temperature

Tuned Frequency (MHz)	Temperature (deg C)	Tolerance (Hz)	Measured Frequency (MHz)	Upper Limit (MHz)	Lower Limit (MHz)	Upper Margin (MHz)	Lower Margin (MHz)
491	0	10000	490,999,979	491,010,000	490,990,000	-10,022	9,979
