

## RF Exposure calculations

From §FCC 1.1310 table 1A, the maximum permissible RF exposure for an uncontrolled environment is  $1\text{mW}/(\text{cm}^2)$ , where,  $(\text{cm}^2) = \text{square cm}$ . The electric field generated for a  $1\text{mW}/(\text{cm}^2)$  exposure (S) is calculated as follows:

$$S = E^2/Z$$

where, S = Power density

E = Electric field

Z = Impedance

so,  $1\text{mW}/(\text{cm}^2) = 10\text{ W}/(\text{m}^2)$

Z is 377 ohm of the impedance of free space, where E and H field are perpendicular.

Thus the Electric field to produce a  $1\text{mW}/(\text{cm}^2)$  exposure is:

$$E = (10 \times 377)^{1/2} = 61.4\text{ V/m}, \text{ which is equivalent to } 1\text{mW}/(\text{cm}^2)$$

Maximum conducted peak output power is 17.70 dBm and maximum antenna gain is 0 dBi. The maximum radiated output power resulted in 58.88 mW.

Using the relationship between electric field E, effective radiated power in watts P, and distance in meters D, the corresponding distance D to produce a  $1\text{mW}/(\text{cm}^2)$  is calculated in the following expression:

$$D = (P \times 30)^{1/2} / E = (58.88 \times 10 \times 30)^{1/2} / 61.4 = 2.16\text{ cm}$$

where, P: maximum effective radiated power measured, 17.70 dBm (58.88 mW)

E: electric field equivalent to  $1\text{mW}/(\text{cm}^2)$ , 61.4 V/m

Notice in Installation Manual:

While installing and operating this transmitter, the radio frequency exposure limit of  $1\text{mW}/(\text{cm}^2)$  may be exceeded at distances close to the transmitter. Therefore the user must maintain a minimum distance of 5 cm from the device and antenna all the time.

The table below identifies the distance where the  $1\text{mW}/(\text{cm}^2)$  exposure limits may be exceeded during continuous transmission using this device.

Peak output power		Calculated RF Exposure Separation Distance (cm)	Minimum RF Exposure Separation Distance from antenna (cm)
dBm	mW		
17.70	58.88	2.16	5
