## RADIO REPORT FOR CERTIFICATION to FCC PART 15 SUBPART C (SECTION 15.225)

### 1.0 INTRODUCTION

Test results and procedures were performed in accordance with the following Federal Communications Commission (FCC) standards/regulations:

47 CFR, Part 15, Subpart C:	Rules for intentional radiators
Section 15.203:	Antenna requirements
Section 15.207:	Conducted Limits
Section 15.209:	Radiated Emission Limits (General requirements)
Section 15.225:	Operation within the band 13.110-14.010 MHz

The sample **complied** with the requirements of 47 CFR, Part 15 Subpart C - Section 15.225.

The measurement procedure used was in accordance with ANSI C63.10: 2013. The instrumentation conformed to the requirements of ANSI C63.2: 2009.

### 1.1 Summary of Results

FCC Part 15 Subpart C	Test Performed	Results
15.203	Antenna Requirement	<b>Complied</b>
15.207	Conducted Limits	<b>Complied</b>
15.209	Radiated Emissions Limits; General Requirements	<b>Complied</b>
15.225(a)	Fundamental Field Strength	<b>Complied</b>
15.225(b and c)	Transmission Mask 13.110-14.010 MHz	<b>Complied</b>
15.225(d)	Spurious Emissions	<b>Complied</b>
15.225(e)	Frequency Tolerance	<b>Complied</b>

### 1.2 Modifications by EMC Technologies

No modifications were performed.

Accredited for compliance with ISO/IEC 17025. The results of the test, calibrations and/or measurement included in this document are traceable to Australian/national standards. NATA is a signatory to the ILAC Mutual Recognition Arrangement for the mutual recognition of the equivalence of testing, calibration and inspection reports.

**This document shall not be reproduced except in full.**

## 2.0 GENERAL INFORMATION

(Information supplied by the Client)

### 2.1 EUT (Transmitter) Details

**Wireless Radio:** 13.56 MHz and 125 kHz  
**Antenna type:** Integral, PCB loop

### 2.2 EUT (Host) Details

**Test Sample:** T11 Multi Tech Reader  
**Model Number:** C305430  
**Serial Number:** 1612507001 and 1612507002  
**Variant:** C305410 (Operates at 13.56 MHz only)  
**Manufacturer:** Gallagher Group Ltd.

**Supply Ratings:** 13.6Vdc 82mA (standby) or 115mA (peak)  
**Highest operating Freq:** 27.12 MHz  
**Dimensions:** 115mm x 70mm x 15mm  
**Interference Cables:** DC cable <3m  
 Comms cable >3m  
 Ethernet cable <3m

**Load/ auxiliary equipment:** Gallagher controller 6000  
 Laptop

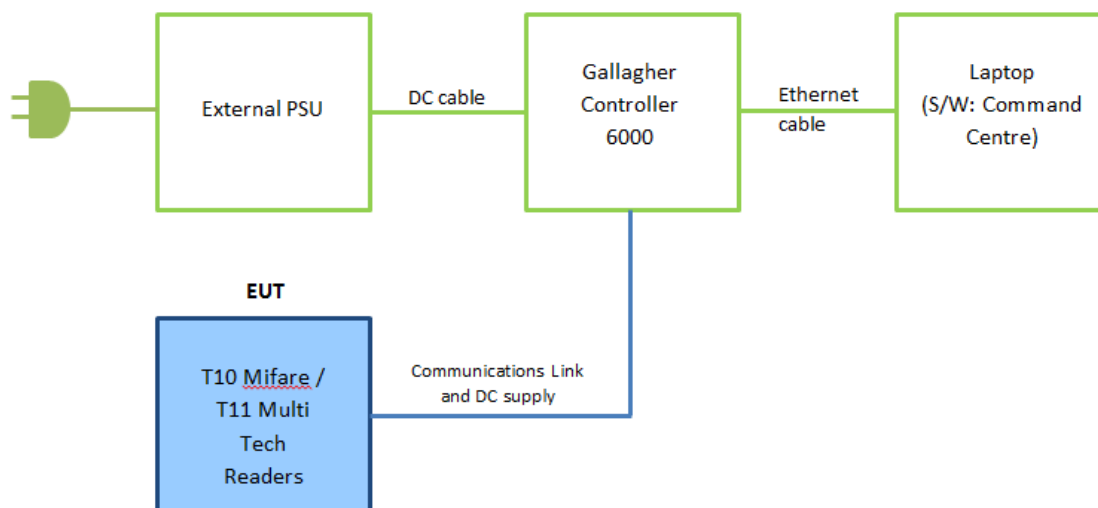

### 2.3 Test Configuration

Conducted Emission measurements were made on a power supply connected to the Controller 6000 and sample. The antenna on the sample (SN 1612507002) was replaced with a resistive load to generate worst case emissions.

Radiated measurements were made on an unmodified sample (SN 1612507002).

FCC:

110Vac, 60Hz

### 2.4 Operational Description

T11 Multi Tech Reader was a smart card proximity reader. It had 2 transceivers operating at fundamental frequencies of 13.56 MHz and 125 kHz. It had 7 wires: 2 wires for DC power and 5 wires for communications. Rated operating Voltage was 13.6Vdc. The C305410 variant operated on 13.56 MHz only, the dual mode was determined to be a worst case version and selected for testing.

Accredited for compliance with ISO/IEC 17025. The results of the test, calibrations and/or measurement included in this document are traceable to Australian/national standards. NATA is a signatory to the ILAC Mutual Recognition Arrangement for the mutual recognition of the equivalence of testing, calibration and inspection reports.

**This document shall not be reproduced except in full.**

## 2.5 Test Facility

### 2.5.1 General

EMC Technologies Pty Ltd is listed by the FCC as a test laboratory able to perform compliance testing for the public. EMC Technologies is listed as an FCC part 47CFR2.948 test lab and may perform the testing required under Parts 15 and 18 – **FCC Registration Number 90560**

EMC Technologies Pty Ltd has also been accredited as a Conformity Assessment Body (CAB) by Australian Communications and Media Authority (ACMA) under the APECTEL MRA and is designated to perform compliance testing on equipment subject to Declaration of Conformity (DoC) and Certification under Parts 15 and 18 of the FCC Commission's rules – **Registration Number 494713 & Designation number AU0001.**

EMC Technologies indoor open area test site (iOATS) have been accepted by Industry Canada for the performance of radiated measurements in accordance with RSS-Gen, Issue 8 - **Industry Canada iOATS number - IC 3569B**

Measurements in this report were performed at EMC Technologies' laboratory in Keilor Park, Victoria Australia.

### 2.5.2 NATA Accreditation

NATA is the Australian National laboratory accreditation body and has accredited EMC Technologies to operate to the IEC/ISO17025 requirements. A major requirement for accreditation is the assessment of the company and its personnel as being technically competent in testing to the standards. This requires fully documented test procedures, continued calibration of all equipment to the National Standard at the National Measurements Institute (NMI) and an internal quality system to ISO 9002. NATA has mutual recognition agreements with the National Voluntary Laboratory Accreditation Program (NVLAP) and the American Association for Laboratory Accreditation (A<sup>2</sup>LA).

EMC Technologies is accredited in Australia by the National Association of Testing Authorities (NATA). All testing in this report has been conducted in accordance with EMC Technologies' scope of NATA accreditation.

The current full scope of accreditation can be found on the NATA website: [www.nata.asn.au](http://www.nata.asn.au)

Accredited for compliance with ISO/IEC 17025. The results of the test, calibrations and/or measurement included in this document are traceable to Australian/national standards. NATA is a signatory to the ILAC Mutual Recognition Arrangement for the mutual recognition of the equivalence of testing, calibration and inspection reports.

**This document shall not be reproduced except in full.**

## 2.6 Test Equipment Calibration

Measurement instrumentation and transducers were calibrated in accordance with the applicable standards by an independent NATA registered laboratory such as Agilent Technologies (Australia) Pty Ltd or the National Measurement Institute (NMI) or in-house. All equipment calibration is traceable to Australian national standards at the National Measurements Institute.

Equipment Type	Make/Model/Serial Number	Last Cal. dd/mm/yy	Due Date dd/mm/yy	Cal. Interval

Note \*1. Internal NATA calibration.

Note \*2. External NATA / A2LA calibration

Accredited for compliance with ISO/IEC 17025. The results of the test, calibrations and/or measurement included in this document are traceable to Australian/national standards. NATA is a signatory to the ILAC Mutual Recognition Arrangement for the mutual recognition of the equivalence of testing, calibration and inspection reports.

**This document shall not be reproduced except in full.**

### 3.0 TEST RESULTS

#### 3.1 §15.203 Antenna Requirement

An internal, permanently attached antenna was incorporated within the T11 Multi Tech Reader ensuring that it could not be replaced.

#### 3.2 §15.207 Conducted Limits

##### 3.2.1 Test Procedure

The arrangement specified in ANSI C63.10: 2013 was adhered to for the conducted EMI measurements. The EUT was placed in the RF screened enclosure and a CISPR EMI Receiver as defined in ANSI C63.2: 2009 was used to perform the measurements.

The EMI Receiver was operated under program control, using the Max-Hold function and automatic frequency scanning, measurement and data logging techniques. The specified 0.15 MHz to 30 MHz frequency range was sub-divided into sub-ranges to ensure that all short duration peaks were captured.

##### 3.2.2 Peak Maximising Procedure

For each of the sub-ranges, the EMI receiver was set to continuous scan with the Peak detector set to Max-Hold mode. The Quasi-Peak detector and the Average detector were then used to measure the actual Quasi-Peak and Average level of the most significant peaks detected.

##### 3.2.3 Calculation of Voltage Levels

The voltage levels were automatically measured in software and compared to the test limit. The method of calculation was as follows:

$$V_{EMI} = V_{Rx} + L_{BPF}$$

Where:

- $V_{EMI}$  = the Measured EMI voltage in dB $\mu$ V to be compared to the limit.
- $V_{Rx}$  = the Voltage in dB $\mu$ V read directly at the EMI receiver.
- $L_{BPF}$  = the insertion loss in dB of the LISN, cables and limiter.

##### 3.2.4 Plotting of Conducted Emission Measurement Data

The measurement data pertaining to each frequency sub-range were concatenated to form a single graph of (peak) amplitude versus frequency. This was performed for both Active and Neutral lines and the composite graph was subsequently plotted. A list of the highest relevant peaks and the respective Quasi-Peak and Average values were also plotted on the graph.

##### 3.2.5 Results of Conducted Emission Measurement

The highest conducted emission measured was > 10 dB below the quasi-peak limit as outlined in §15.207.

Accredited for compliance with ISO/IEC 17025. The results of the test, calibrations and/or measurement included in this document are traceable to Australian/national standards. NATA is a signatory to the ILAC Mutual Recognition Arrangement for the mutual recognition of the equivalence of testing, calibration and inspection reports.

7	1.041	27.0	56	-29.0	12.0	46	-34.0

### 3.2.6 Conclusion

The conducted emissions were below the average and quasi-peak limits of §15.207.

Accredited for compliance with ISO/IEC 17025. The results of the test, calibrations and/or measurement included in this document are traceable to Australian/national standards. NATA is a signatory to the ILAC Mutual Recognition Arrangement for the mutual recognition of the equivalence of testing, calibration and inspection reports.

**This document shall not be reproduced except in full.**

### 3.3 §15.209 Radiated emission limits; general requirements

The general requirement limits were applied to the measurements of §15.225(d).

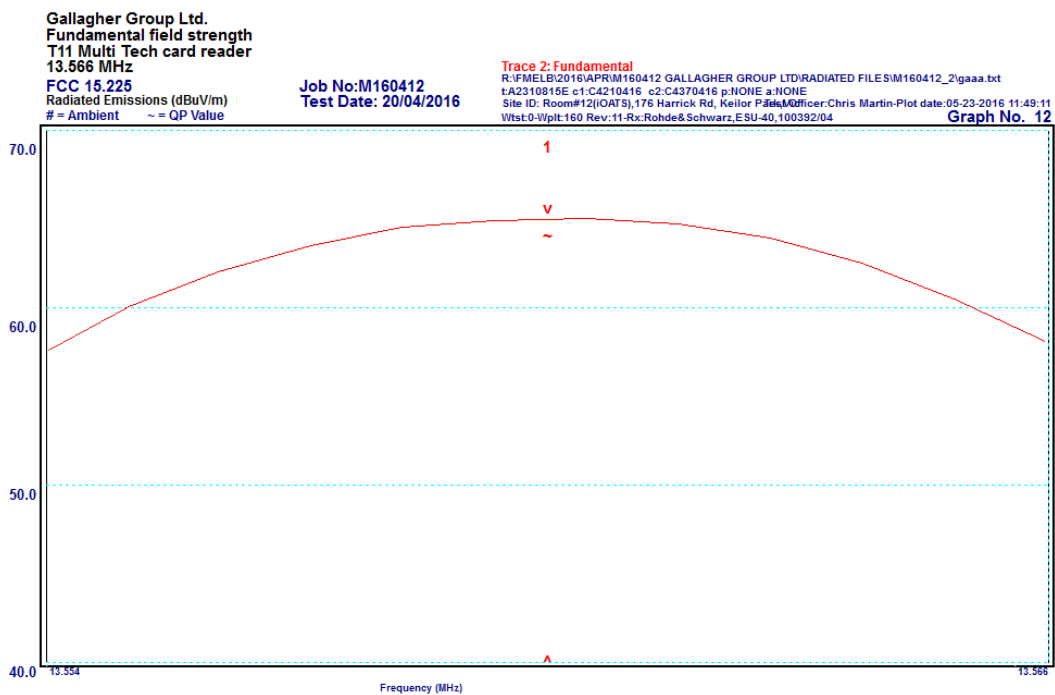

### 3.4 §15.225(a) Fundamental Field Strength

The field strength of the fundamental transmitted frequency was measured inside a compliant CISPR16-1-4 semi-anechoic chamber. The EUT was positioned on a test turn-table and rotated through 360° to determine the highest emissions. The measurement antenna was also varied between 1 and 4 metres height. The measurements were made with the loop antenna in three orthogonal orientations.

#### 3.4.1 Result

Measure Antenna	Frequency MHz	E(peak) dBµV/m	E(peak) µV/m	30 m Limit µV/m	10 m Limit µV/m	Result
X	13.56	61.1	1,135	15,848	47,315	Complied
Y	13.56	44.8	173	15,848	47,315	Complied
Z	13.56	65.3	1,841	15,848	47,315	Complied

All measurements were made at a distance of 10 metres. The fundamental emissions were measured using a peak detector and as the level did not exceed the limit further measurements were not made.

#### 3.4.2 Conclusion

The field strength of the fundamental transmitted signal complied with the limit of §15.225(a).

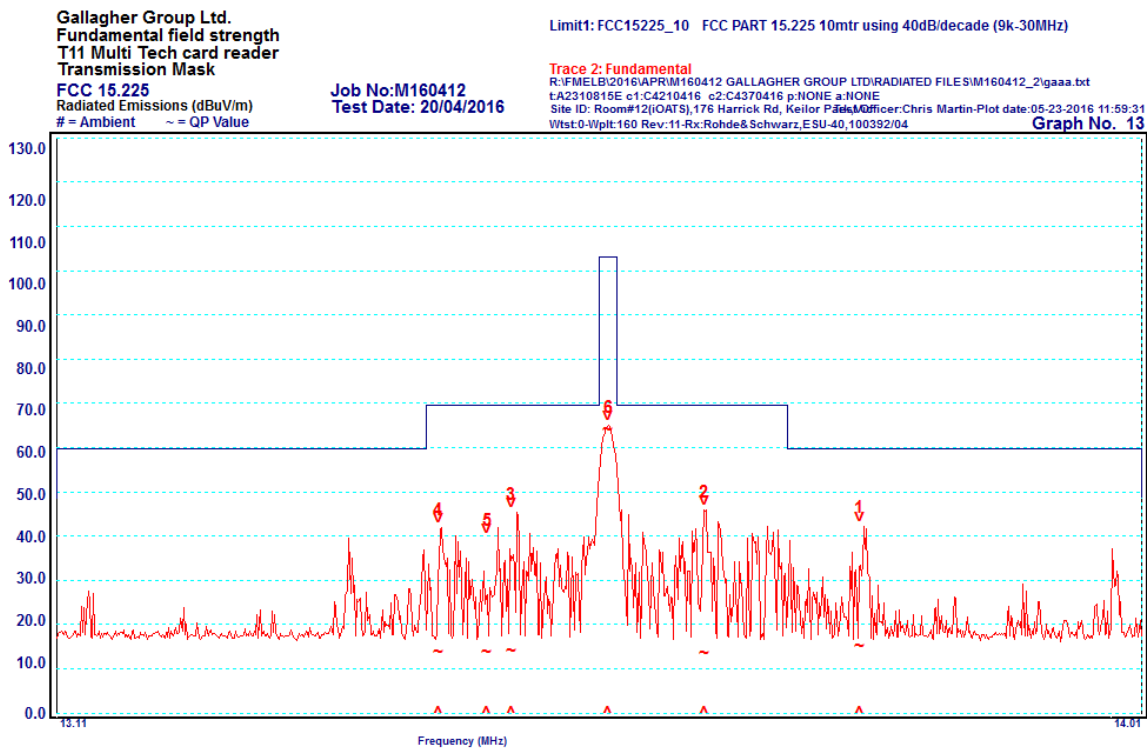

### 3.5 §15.225(b and c) Transmission Mask 13.110-14.010 MHz

Measurements were made at 10 metres using a 0.6 metre loop antenna. Initial investigations were made to find the EUT and measuring antenna orientations that produce the highest reading on the EMI receiver/spectrum analyser. These measurements were made at the transmit frequency, 13.56 MHz.

With the EUT and measuring antenna orientated in the position giving maximum emission measurements with a bandwidth of 9 kHz were made between 13.110 MHz and 14.010 MHz. The following limit mask applied:

Frequency band (MHz)	Field strength limit at 30 m (µV/m)	Equivalent field strength at 10 m (dBµV/m)
13.110 to 13.410	106	59.6
13.410 to 13.553	334	69.6
13.553 to 13.567	15,848	103.1
13.567 to 13.710	334	69.6
13.710 to 14.010	106	59.6

#### 3.5.1 Result

Point	Frequency (MHz)	Peak at 10m (dBµV/m)	Limit at 10m (dBµV/m)	Result
1	13.77	42.3	59.6	Complied
2	13.64	46.0	69.6	Complied
3	13.48	45.4	69.6	Complied
4	13.42	41.8	69.6	Complied
5	13.46	39.5	69.6	Complied
6	13.56	65.0	103.1	Complied

#### 3.5.2 Conclusion

The transmitted signal complied with the limit mask of §15.225(b and c).

		<p>Accredited for compliance with ISO/IEC 17025. The results of the test, calibrations and/or measurement included in this document are traceable to Australian/national standards. NATA is a signatory to the ILAC Mutual Recognition Arrangement for the mutual recognition of the equivalence of testing, calibration and inspection reports.</p>
<p><b>This document shall not be reproduced except in full.</b></p>		

### 3.6 §15.225(d) Spurious Emissions

Radiated EMI tests were performed in a semi-anechoic chamber compliant with CISPR16-1-4. The chamber allows a 2m x 2m x 2m test volume up to 6 GHz, at a test distance of 3 metres and 10 metres.

The test frequency range was sub-divided into smaller bands with sufficient frequency resolution to permit reliable display and identification of possible EMI peaks. Measurements between 9 KHz and 30 MHz were made at 10 metres using a 0.6 metre loop antenna and a calibrated Biconilog antenna was used for measurements between 30 MHz and 1000 MHz. Calibrated EMCO 3115, EMCO 3116 and ETS standard gain horn antennas were used for measurements between 1 to 25 GHz.

The EUT was slowly rotated with the spectrum analyser was set to Max-Hold. This was performed for two antenna heights. When an emission was located, it was positively identified and its maximum level found by rotating the automated turntable and by varying the antenna height. The procedure was repeated with the device orientated in three orthogonal axis to further maximise the emission.

Each significant peak was investigated with the Peak/Average Detectors. The measurement data for each frequency range was corrected for cable losses, antenna factors and preamplifier gain. This process was performed for both horizontal and vertical antenna polarisations.

#### 3.6.1 Calculation of field strength

The field strength was calculated automatically by the software using all the pre-stored calibration data. The method of calculation is shown below:

$$E = V + AF - G + L$$

Where:

- E** = Radiated Field Strength in dB $\mu$ V/m.
- V** = EMI Receiver Voltage in dB $\mu$ V. (measured value)
- AF** = Antenna Factor in dB. (stored as a data array)
- G** = Preamplifier Gain in dB. (stored as a data array)
- L** = Cable loss in dB. (stored as a data array of Insertion Loss versus frequency)

Accredited for compliance with ISO/IEC 17025. The results of the test, calibrations and/or measurement included in this document are traceable to Australian/national standards. NATA is a signatory to the ILAC Mutual Recognition Arrangement for the mutual recognition of the equivalence of testing, calibration and inspection reports.

**This document shall not be reproduced except in full.**

### 3.6.2 Frequency Band: 9 kHz - 30 MHz

Measurements were made at a distance of 10 metres. The measurement of emissions between 9 kHz – 150 kHz were made with a resolution bandwidth (RBW) of 200 Hz and the video bandwidth (VBW) of 3 kHz, 150 kHz – 30 MHz were measured with the resolution bandwidth (RBW) of 9 kHz and the video bandwidth (VBW) of 30 kHz.

### 3.6.3 Frequency Band: 30 - 1000 MHz

Measurements were made at a distance of 10 metres. The measurement of emissions between 30 - 1000 MHz were made with a resolution bandwidth (RBW) of 120 kHz and the video bandwidth (VBW) of 300 kHz.

#### 3.6.3.1 Vertical Polarisation

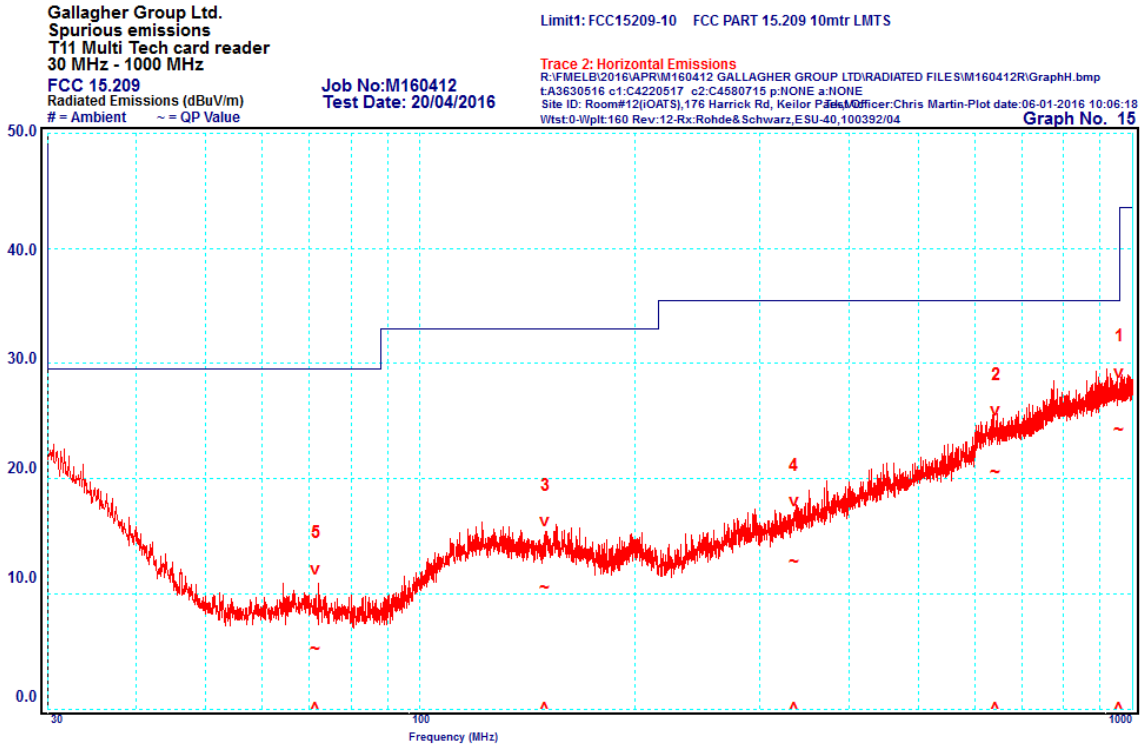

Point	Frequency (MHz)	Quasi-Peak (dBµV/m)	Limit (dBµV/m)	Margin (dB)
1	60.21	25.7	29.5	-3.8
2	180.03	29.0	33.0	-4.0
3	89.99	27.2	33.0	-5.8
4	125.01	25.8	33.0	-7.2
5	719.90	27.8	35.5	-7.7
6	137.15	19.8	33.0	-13.2
7	674.90	21.1	35.5	-14.4
8	244.07	18.8	35.5	-16.7
9	67.35	12.3	29.5	-17.2

Accredited for compliance with ISO/IEC 17025. The results of the test, calibrations and/or measurement included in this document are traceable to Australian/national standards. NATA is a signatory to the ILAC Mutual Recognition Arrangement for the mutual recognition of the equivalence of testing, calibration and inspection reports.

**This document shall not be reproduced except in full.**

**3.6.3.2 Horizontal Polarisation**

Point	Frequency (MHz)	Quasi-Peak (dBµV/m)	Limit (dBµV/m)	Margin (dB)
1	957.61	24.2	35.5	-11.3
2	642.87	20.5	35.5	-15.0
3	149.86	10.5	33.0	-22.5
4	334.83	12.8	35.5	-22.7
5	71.36	5.2	29.5	-24.3

**3.6.4 Conclusion**

The spurious emissions complied with the general limits of §15.209 by a margin of 0.8 dB.

**3.7 §15.225(e) Frequency Tolerance**

The frequency tolerance of the carrier signal shall be maintained within ±0.01% of the operating frequency over a temperature variation of -20 °C to + 50 °C at normal supply voltage, and for a variation in the primary supply voltage from 85% to 115% of the rated supply voltage at a temperature of 20 °C. For battery operated equipment, the equipment tests shall be performed using a new battery.

Limit (MHz)	Temperature (°C)	Frequency (MHz)	Result
13.558644 < f < 13.561356	-20	13.559529	Complied
	20	13.559487	Complied
	50	13.559484	Complied

Limit (MHz)	Supply voltage (V)	Frequency (MHz)	Result
13.558644 < f < 13.561356	10.2	13.559487	Complied
	12.0	13.559487	Complied
	13.8	13.559493	Complied

Accredited for compliance with ISO/IEC 17025. The results of the test, calibrations and/or measurement included in this document are traceable to Australian/national standards. NATA is a signatory to the ILAC Mutual Recognition Arrangement for the mutual recognition of the equivalence of testing, calibration and inspection reports.

## 4.0 COMPLIANCE STATEMENT

The T10 Mifare Reader, Model C305400, tested on behalf of Gallagher Group Ltd. **complied** with the requirements of 47 CFR, Part 15 Subpart C - Rules for Radio Frequency Devices (intentional radiators), Section 15.225 - Operation within the band 13.110-14.010 MHz.

Results were as follows:

FCC Part 15 Subpart C	Test Performed	Results
15.203	Antenna Requirement	Complied
15.207	Conducted Limits	Complied
15.209	Radiated Emissions Limits; General Requirements	Complied
15.225(a)	Fundamental Field Strength	Complied
15.225(b and c)	Transmission Mask 13.110-14.010 MHz	Complied
15.225(d)	Spurious Emissions	Complied
15.225(e)	Frequency Tolerance	Complied

## 5.0 MEASUREMENT UNCERTAINTY

EMC Technologies has evaluated the equipment and the methods used to perform the emissions testing. The estimated measurement uncertainties for emissions tests shown within this report are as follows:

**Conducted Emissions:** 9 kHz to 30 MHz ±3.2 dB

**Radiated Emissions:**

9 kHz to 30 MHz	±4.1 dB
30 MHz to 300 MHz	±5.1 dB
300 MHz to 1000 MHz	±4.7 dB
1 GHz to 18 GHz	±4.6 dB

**Peak Output Power:** ±1.5 dB

The above expanded uncertainties are based on standard uncertainties multiplied by a coverage factor of k=2, providing a level of confidence of approximately 95%.

Accredited for compliance with ISO/IEC 17025. The results of the test, calibrations and/or measurement included in this document are traceable to Australian/national standards. NATA is a signatory to the ILAC Mutual Recognition Arrangement for the mutual recognition of the equivalence of testing, calibration and inspection reports.
