

Dear Mr. Compton,

We have a few issues to resolve on this application.

1. Please provide data responsive to 15.31(e) voltage variation requirements. Unlike your previous transmitters, this unit is primarily powered by an external 12VDC source. We need measurements made of the fundamental at 85% and 115% of nominal supply voltage.

New data provided and placed in test report.

2. Please provide details on the cables attached to the unit during radiated emissions testing. Details include shielding status, length, and use of ferrite, if applicable.

New data provided and placed in test report.

Best regards

Barry C. Quinlan
Certification & Telecom Manager
