

Product Description

The EUT is a low power 125 kHz transmitter.

The EUT (pcPROOXH100) is used for computer access and logon capability for existing HID badge users. The EUT will free the user from entering passwords and increase security. As the user approaches their PC the EUT detects the users HID Badge granting access. If the PC user walks away the system detects this event and is automatically secured and enters into a screensaver mode. When an unauthorized person attempts to use the PC, access is denied.

The EUT will only be marketed to corporations. It works in conjunction with security systems in offices and factories.
