

Daphne,

Regarding the SAR report:

- 1) The SAR report is missing the SAR plots for the test data including Z-axis scans for the worse case data. Please provide. Several aspects of the SAR report can not be proofed without this information. These plots should typically contain crest factors, probe factors, liquid parameters, test information, and other important information.
- 2) The report should include the composition, ingredients, and amounts for tissue liquid listed.
- 3) better descriptions of extrapolation & interpolation procedures used by the software.

Thank You,

Timothy R. Johnson
