TEST REPORT FOR

TouchSecure Mullion Model: Connectivity MUL

Tested To The Following Standards:

FCC Part 15 Subpart C Sections 15.207, 15.225 and RSS 210 Issue 8

Report No.: 93717-11

Date of issue: April 15, 2013

This test report bears the accreditation symbol indicating that the testing performed herein meets the test and reporting requirements of ISO/IEC 17025 under the applicable scope of EMC testing for CKC Laboratories, Inc.

We strive to create long-term, trust based relationships by providing sound, adaptive, customer first testing services. We embrace each of our customers' unique EMC challenges, not as an interruption to set processes, but rather as the reason we are in business.

This report contains a total of 65 pages and may be reproduced in full only. Partial reproduction may only be done with the written consent of CKC Laboratories, Inc.

Report Authorization

The test data contained in this report documents the observed testing parameters pertaining to and are relevant for only the sample equipment tested in the agreed upon operational mode(s) and configuration(s) as identified herein. Compliance assessment remains the client's responsibility. This report may not be used to claim product endorsement by A2LA or any government agencies. This test report has been authorized for release under quality control from CKC Laboratories, Inc.

The EUT is a fix device. It is powered by DC power supply at 12VDC which is outside of the chamber. The EUT is placed on 80 cm table at the center of turning table. The EUT is connected to the Laptop by RJ45 cable in order to communication.

The EUT is set continuously transmitting.

15.31(e) compliance: the supply voltage was varied between 85% and 115% of the nominal rated supply voltage 12VDC (10.2 VDC and 13.8VDC), no change in the fundamental signal level was observed.

Conducted Emission

Frequency Range: 150kHz to 30MHz

Temperature: 20.7°C Humidity: 41 %

Atmospheric Pressure: 101.6kPa

High Clock: 48 MHz

Software Used: Hyper Terminal and Ethernet Emulator

Transmitting Operation Frequency: 125kHz and 13.56MHz

Mode: Power by DC power supply (12VDC)

Note:

Conducted emissions are being performed on AC input of the DC Power supply.

According to 15.207(b), the limit shall not apply to carrier current systems operating as intentional radiators on frequencies below 30 MHz.

CKC Laboratories, Inc. Date: 3/29/2013 Time: 11:00:04 Identive Group, Inc WO#: 93717 Test Lead: Black 120V 60Hz Sequence#: 40

The above manufacturer name, Identive Group, Inc. was referenced by CKC Laboratories during testing. Since the time of testing, it has come to CKC Laboratories attention the manufacturer name should read Indentive GmbH. The screen capture was taken at the time of testing and cannot be changed.

Test Location: CKC Laboratories, Inc. • 1120 Fulton Places • Fremont, CA 94539 • (510) 249-1170

Customer: **Identive GmbH**

Specification: 15.207 AC Mains - Average

Test Conditions / Notes:

Conducted Emission

Frequency Range: 150kHz to 30MHz

Temperature: 20. 7°C Humidity: 41 %

Atmospheric Pressure: 101.6kPa

High Clock: 48 MHz

Software Used: Hyper Terminal and Ethernet Emulator Transmitting Operation Frequency: 125kHz and 13.56MHz

Mode: Power by DC power supply (12VDC)

Note: Conducted emissions are being performed on AC input of the DC Power supply.

According to 15.207(b), the limit shall not apply to carrier current systems operating as intentional radiators on

frequencies below 30 MHz

Test Conditions / Notes:

Fundamental of the EUT Temperature: 20.5°C Humidity: 39 %

Atmospheric Pressure: 101.3 kPa

High Clock: 48 MHz

Software Used: Hyper Terminal and Ethernet Emulator Transmitting Operation Frequency: 125kHz and 13.56MHz

RBW=VBW=200Hz for 125kHz RBW=VBW=13.56MHz for 13.56MHz **Mode: Power by DC power supply (12VDC)**

The EUT is a fix device. It is powered by DC power supply at 12VDC which is outside of the chamber. The EUT is placed on 80 cm table at the center of turning table. The EUT is connected to the Laptop by RJ45 cable in order to communication. The EUT is set continuously transmitting.

Note: The EUT is connected to a DC power supply by PIGTAIL cable.

SUPPLEMENTAL INFORMATION

Measurement Uncertainty

Uncertainty Value	Parameter
4.73 dB	Radiated Emissions
3.34 dB	Mains Conducted Emissions
3.30 dB	Disturbance Power

The reported measurement uncertainties are calculated based on the worst case of all laboratory environments from CKC Laboratories, Inc. test sites. Only those parameters which require estimation of measurement uncertainty are reported. The reported worst case measurement uncertainty is less than the maximum values derived in CISPR 16-4-2. Reported uncertainties represent expanded uncertainties expressed at approximately the 95% confidence level using a coverage factor of k=2. Compliance is deemed to occur provided measurements are below the specified limits.

Emissions Test Details

TESTING PARAMETERS

Unless otherwise indicated, the following configuration parameters are used for equipment setup: The cables were routed consistent with the typical application by varying the configuration of the test sample. Interface cables were connected to the available ports of the test unit. The effect of varying the position of the cables was investigated to find the configuration that produced maximum emissions. Cables were of the type and length specified in the individual requirements. The length of cable that produced maximum emissions was selected.

The equipment under test (EUT) was set up in a manner that represented its normal use, as shown in the setup photographs. Any special conditions required for the EUT to operate normally are identified in the comments that accompany the emissions tables.

The emissions data was taken with a spectrum analyzer or receiver. Incorporating the applicable correction factors for distance, antenna, cable loss and amplifier gain, the data was reduced as shown in the table below. The corrected data was then compared to the applicable emission limits. Preliminary and final measurements were taken in order to ensure that all emissions from the EUT were found and maximized.

CORRECTION FACTORS

The basic spectrum analyzer reading was converted using correction factors as shown in the highest emissions readings in the tables. For radiated emissions in $dB\mu V/m$, the spectrum analyzer reading in $dB\mu V$ was corrected by using the following formula. This reading was then compared to the applicable specification limit.

+	Antenna Factor	(dB)			
+	Cable Loss	(dB)			
-	Distance Correction	(dB)			
-	Preamplifier Gain	(dB)			
=	Corrected Reading	(dBμV/m)			

TEST INSTRUMENTATION AND ANALYZER SETTINGS

The test instrumentation and equipment listed were used to collect the emissions data. A spectrum analyzer or receiver was used for all measurements. Unless otherwise specified, the following table shows the measuring equipment bandwidth settings that were used in designated frequency bands. For testing emissions, an appropriate reference level and a vertical scale size of 10 dB per division were used.

MEASURING EQUIPMENT BANDWIDTH SETTINGS PER FREQUENCY RANGE					
TEST	BEGINNING FREQUENCY	ENDING FREQUENCY	BANDWIDTH SETTING		
CONDUCTED EMISSIONS	150 kHz	30 MHz	9 kHz		
RADIATED EMISSIONS	9 kHz	150 kHz	200 Hz		
RADIATED EMISSIONS	150 kHz	30 MHz	9 kHz		
RADIATED EMISSIONS	30 MHz	1000 MHz	120 kHz		
RADIATED EMISSIONS	1000 MHz	>1 GHz	1 MHz		

SPECTRUM ANALYZER/RECEIVER DETECTOR FUNCTIONS

The notes that accompany the measurements contained in the emissions tables indicate the type of detector function used to obtain the given readings. Unless otherwise noted, all readings were made in the "positive peak" detector mode. Whenever a "quasi-peak" or "average" reading was recorded, the measurement was annotated with a "QP" or an "Ave" on the appropriate rows of the data sheets. In cases where quasi-peak or average limits were employed and data exists for multiple measurement types for the same frequency then the peak measurement was retained in the report for reference, however the numbering for the affected row was removed and an arrow or carrot ("A") was placed in the far left-hand column indicating that the row above takes precedence for comparison to the limit. The following paragraphs describe in more detail the detector functions and when they were used to obtain the emissions data.

Peak

In this mode, the spectrum analyzer or receiver recorded all emissions at their peak value as the frequency band selected was scanned. By combining this function with another feature called "peak hold," the measurement device had the ability to measure intermittent or low duty cycle transient emission peak levels. In this mode the measuring device made a slow scan across the frequency band selected and measured the peak emission value found at each frequency across the band.

Quasi-Peak

Quasi-peak measurements were taken using the quasi-peak detector when the true peak values exceeded or were within 2 dB of a quasi-peak specification limit. Additional QP measurements may have been taken at the discretion of the operator.

Average

Average measurements were taken using the average detector when the true peak values exceeded or were within 2 dB of an average specification limit. Additional average measurements may have been taken at the discretion of the operator. If the specification or test procedure requires trace averaging, then the averaging was performed using 100 samples or as required by the specification. All other average measurements are performed using video bandwidth averaging. To make these measurements, the test engineer reduces the video bandwidth on the measuring device until the modulation of the signal is filtered out. At this point the measuring device is set into the linear mode and the scan time is reduced.
