MANUFACTURER'S NAME	Digi International
NAME OF EQUIPMENT	Digi Connect Wi-EM 802.11b radio to 2 serial ports converter module
TYPE OF EQUIPMENT	802.11B 11 Mbit 2.4 GHz radio transceiver to dual TTL serial port module
MODEL NUMBER	**50000879-xx Rev 1P**
MANUFACTURER'S ADDRESS	11001 Bren Road East Minnetonka, MN 55343
TEST REPORT NUMBER	WC402191
TEST DATE	07 May 2004 29 June 2004

According to testing performed at TÜV Product Service Inc, the above-mentioned unit is in compliance with the electromagnetic compatibility requirements defined in FCC Part 15 Subpart C Sections 15.207 and 15.247.

It is the manufacturer's responsibility to assure that additional production units of this model are manufactured with identical electrical and mechanical characteristics. Any modifications necessary for compliance made during testing on the above mentioned date(s) must be implemented in all production units for compliance to be maintained.

TÜV Product Service Inc, as an independent testing laboratory, declares that the equipment tested as specified above conforms to the requirements of FCC Part 15 Subpart C Sections 15.207 and 15.247.

Emission Test Results:

6 dB Bandwidth [15.247 (a)(2)]

The requirements are ■ - MET ☐ - NOT MET

The minimum 6 dB bandwidth shall be at least 500 kHz.

Remarks: See plots on pages A4 – A6. Bandwidths are shown to be 9.4 to 9.5 MHz.

Duty Cycle

Remarks: See plots on pages A7 and A8. Duty cycle correction factor is –12dB and is NOT applied

Peak Power Out [15.247 (b)]

The requirements are ■ - MET ☐ - NOT MET

Maximum peak power output shall be 1 watt.

Remarks: See plots on pages A9 - A14. Max peak output power is shown to be 0.17 W (22.25 dBm when unit is on Channel 6).

Antenna Directional Gain [15.247 (b)(4)(i)]

The requirements are ■ - MET ☐ - NOT MET

The antenna directional gain is less than 6 dBi. For antennas with directional gain greater than 6 dBi the maximum peak output power is reduced by 1 dB for every 3 dB that the directional gain is over 6 dBi.

Remarks: The antenna directional gain is 2 dBi.

Peak Power Spectral Density – [15.247 (d)]

The requirements are ■ - MET ☐ - NOT MET

Peak power spectral density shall not be greater than 8 dBm in any 3 kHz band.

Remarks: See plots on pages A9 – A11. Maximum peak power spectral density is –15.8 dBm/3 kHz.

Emission Test Results Continued:

FCC 15.207 - Conducted emissions 150 kHz - 30 MHz

The requirements are ■ - MET ☐ - NOT MET

Minimum margin of compliance 18 dB at 150.0 kHz

Maximum margin of non-compliance _____ dB at _____ MHz

Remarks: See Data on pages A23 – A26.

Spurious radiated emissions (electric field) 30 MHz - 1000 MHz (restricted bands)

The requirements are ■ - MET ☐ - NOT MET

Minimum margin of compliance 15 dB at 608.2 MHz

Maximum margin of non-compliance _____ dB at _____ MHz

Remarks: See data on pages A27 – A33.

Spurious conducted emissions 30 MHz – 25 GHz

The requirements are ■ - MET ☐ - NOT MET

Minimum margin of compliance >10 dB at _____ MHz

Maximum margin of non-compliance _____ dB at _____ MHz

Remarks: See data on pages A15 – A22. The limit is –20 dBc in any 100 kHz band outside the operating band.

Special attention is paid to ensure band edge compliance.

Equivalent Radiated emissions 1 GHz – 25 GHz (restricted bands)

The requirements are ■ - MET ☐ - NOT MET

Minimum margin of compliance 3 dB at 4874.0 MHz

Maximum margin of non-compliance _____ dB at _____ MHz

Remarks: See data on pages A33 – A36.

GENERAL REMARKS:

The EUT was tested with the antenna connected directly to the rf module and with a 12” extension cable between the rf module and the antenna.

SUMMARY:

The requirements according to the technical regulations are

■ - met

☐ - **not** met.

The device under test does

■ - fulfill the general approval requirements mentioned on page 3.

☐ - **not** fulfill the general approval requirements mentioned on page 3.

MEASUREMENT PROTOCOL

GENERAL INFORMATION

Test Methodology

Conducted and radiated emission testing is performed according to the procedures in International Special Committee on Radio Interference (CISPR) Publication 22 (1993), European Standard EN 55022 and Australian Standard AS 3548 (which are based on CISPR 22).

The Japanese standard, "Voluntary Control Council for Interference (VCCI) by Data Processing Equipment and Electronic Office Machines, Technical Requirements" is technically equivalent to CISPR 22 (1993). For official compliance, a conformance report must be sent to and accepted by the VCCI.

In compliance with FCC Docket 92-152, "Harmonization of Rules for Digital Devices Incorporate International Standards", testing for FCC compliance may be done following the ANSI C63.4-1992 procedures and using the CISPR 22 Limits.

Measurement Uncertainty

The test system for conducted emissions is defined as the LISN, tuned receiver or spectrum analyzer, and coaxial cable. The test system for radiated emissions is defined as the antenna, the pre-amplifier, the spectrum analyzer and the coaxial cable. These test systems have a measurement uncertainty of ±4.5 dB. The equipment comprising the test systems are calibrated on an annual basis.

Justification

The Equipment Under Test (EUT) is configured in a typical user arrangement in accordance with the manufacturer's instructions. A cable is connected to each available port and either terminated with a peripheral into it's characteristic impedance or left unterminated. When appropriate, the cables are manually manipulated with respect to each other to obtain maximum emissions from the unit.

CONDUCTED EMISSIONS

The final level, expressed in dBμV, is arrived at by taking the reading directly from the EMI receiver. This level is compared directly to the CISPR limit.

To convert between dBμV and μV, the following conversions apply:

dBμV = 20(log μV)

μV = Inverse log(dBμV/20)

RADIATED EMISSIONS

The final level, expressed in dBμV/m, is arrived at by taking the reading from the spectrum analyzer (Level dBμV), adding the antenna correction factor and cable loss factor (Factor dB) to it, then subtracting the preamp gain. This result then has the CISPR limit subtracted from it to provide the Delta which gives the tabular data as shown in the data sheets in Attachment A.

Example:

FREQ (MHz)	LEVEL (dBuV)		CABLE/ANT/PREAMP (dB)	(dB/m)	(dB)		FINAL (dBuV/m)		POL/HGT/AZ (m)	(deg)	DELTA1 EN 55022 A
60.80	42.5Qp	+	1.2	+ 10.9	- 25.5	=	29.1	V	1.0	0.0	-10.9

DETAILS OF TEST PROCEDURES

General Standard Information

The test methods used comply with ANSI C63.4-1992 - "Methods of Measurement of Radio-Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the Range of 9 kHz to 40 GHz."

Conducted Emissions

Conducted emissions on the 50 Hz and/or 60 Hz power interface of the EUT are measured in the frequency range of 150 kHz to 30 MHz. The measurements are performed using a receiver, which has CISPR characteristic bandwidth and quasi-peak detection, and a Line Impedance Stabilization Network (LISN), with 50 Ω/50 μH (CISPR 16) characteristics. Table top equipment is placed on a non-conducting table 80 centimeters above the floor and is positioned 40 centimeters from the vertical ground plane (wall) of the screen room. In some cases, a pre-scan using a spectrum analyzer is initially performed on the units comprising the system under test to locate the highest emissions. If the minimum passing margin appears to be less than 20 dB with a peak mode measurement, the emissions are re-measured using a tuned receiver or spectrum analyzer with quasi-peak and average detection and recorded on the data sheets.

Radiated Emissions

Radiated emissions from the EUT are measured in the frequency range of 30 to 25000 MHz using a spectrum analyzer and appropriate broadband linearly polarized antennas. Measurements between 30 MHz and 1000 MHz are made with 120 kHz/6 dB bandwidth and quasi-peak detection and measurements above 1000 MHz are made with a 1 MHz/6 dB bandwidth and peak detection. Table top equipment is placed on a 1.0 X 1.5 meter non-conducting table 80 centimeters above the ground plane. Floor standing equipment is placed directly on the turntable/ground plane. Interface cables that are closer than 40 centimeters to the ground plane are bundled in the center in a serpentine fashion so they are at least 40 centimeters from the ground plane. Cables to simulators/testers (if used in this test) are routed through the center of the table and to a screen room located outside the test area. The antenna is positioned 3, 10 or 30 meters horizontally from the EUT. To locate maximum emissions from the test sample the antenna is varied in height from 1 to 4 meters, measurement scans are made with both horizontal and vertical antenna polarizations and the EUT are rotated 360 degrees. The transmitter is rotated through 3 orthogonal axes in order to determine the maximum emission levels.
