Dear Mr Collet,

You will find here under our conclusions about the measurement of the receiver bandwidth of your products.

GCI680 and GEMACCESS receiving bandwidth:

The transmitter section is permanently connected to the antenna and to the receiving input.

When the contactless card comes in the vicinity of the GCI680 loop antenna, the energy detected by the receiving section is damped.

As the only periodic part of the receiving section is composed by a LC tuned circuit and due to the fact that the Q of that circuit is depending on the vicinity of the card, the receiving bandwidth is variable and difficult to quantify.

For such a specific design, if a bandwidth measurement is required, we need technical guidance from the FCC.

Best regards.

Gilbert Feraud
