Tune-Up Procedure Description for MLG0208

Power Adjustments

The RF power output of the modem is preset during the manufacturing process via software-controlled adjustment of calibration parameters referenced to a base-station simulator.

Under normal operation, the RF output power is maintained via an ALC circuit. Neither the integrator nor end-user has access to the calibration/power adjustment of the device.

Frequency Adjustments

Under normal operation, the transmitter uses a frequency synthesizer synchronized a base-station clock, thus there are no frequency alignments that must be made.

Scott Yarberry

A handwritten signature in black ink that reads "Scott Yarberry". The signature is written in a cursive, slightly slanted style.
