

## EMISSION -- TESTREPORT

Testreport file no. : **T 19197-1-00 MN** Date : July 30, 2000  
of issue

Model : Transmitter for detecting leaks in water distribution systems.

Type : Permalog Logger I

Applicant : Palmer environmental Ltd.

Manufacturer : Palmer environmental Ltd.

Licence holder : Palmer environmental Ltd.

Address : TY COCH HOUSE, CWMBRAN  
GWENT, NP44 3AW, UK

**Test result** accrdg. to the  
regulation(s) at page 3

:

**POSITIV**

This testreport with appendix consists of **52** pages.  
The testresult only responds to the tested sample. It is not allowed to copy  
this report even partly without the allowance of the testlaboratory.

**POWER SUPPLY SYSTEM UTILIZED**

Power supply system : Battery Unom = 3 V DC

**STATEMENT OF MEASUREMENT UNCERTAINTY**

The data and results referenced in this document are true and accurate. The reader is cautioned that there may be errors within the calibration limits of the equipment and facilities that can account for a nominal measurement error of  $\pm 4\text{dB}$ . Furthermore, component and process variability of devices similar to that tested may result in additional deviation. The manufacturer has the sole responsibility of continued compliance of the device.

**SHORT DESCRIPTION OF THE EQUIPMENT UNDER TEST (EUT)**

Transmitter for detecting leaks in water distribution systems.  
The EUT transmits to the receiver 1 KHz to indicates no leak and 2 KHz to indicates Leak.  
Number of received/tested samples: 1 / 1

**DEFINITIONS FOR SYMBOLS USED IN THIS TEST REPORT**

■ - Black box indicates that the listed condition, standard or equipment is applicable for this Report.  
o - Blank box indicates that the listed condition, standard or equipment was not applicable for this Report.

**M E A S U R E M E N T P R O T O C O L F O R F C C , V C C I**  
**A N D A U S T E L**

**Test Methodology**

Conducted and radiated emission testing is performed according to the procedures in International Special Committee on Radio Interference (CISPR) Publication 22 (1993), European Standard EN 55022 and Australian Standard AS 3548 (which are based on CISPR 22).

The Japanese standard, "Voluntary Control Council for Interference (VCCI) by Data Processing Equipment and Electronic Office Machines, Technical Requirements" is technically equivalent to CISPR 22 (1993). For official compliance, a conformance report must be sent to and accepted by the VCCI.

In compliance with FCC Docket 92-152, "Harmonization of Rules for Digital Devices Incorporate International Standards", testing for FCC compliance may be done following the ANSI C63.4-1992 procedures and using the FCC limits or the CISPR 22 Limits.

**Measurement Error**

The test system for conducted emissions is defined as the LISN, tuned receiver and coaxial cable. The test system for spurious emissions is defined as the antenna, the pre-amplifier, the tuned receiver and the coaxial cable. These test systems have an expected error of  $\pm 3$  dB. The equipment comprising the test systems are calibrated on an annual basis.

**Justification**

The Equipment Under Test (EUT) is configured in a typical user arrangement in accordance with the manufacturer's instructions. A cable is connected to each available port and either terminated with a peripheral into its characteristic impedance or left unterminated. When appropriate, the cables are manually manipulated with respect to each other to obtain maximum emissions from the unit.

**General Standard Information**

The test methods used comply with CISPR Publication 22 (1993), EN 55022 (1987) and AS 3548 (1992) - "Limits and Methods of Measurement of Radio Interference Characteristics of Information Technology Equipment" and with ANSI C63.4-1992 - "Methods of Measurement of Radio-Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the Range of 9 kHz to 40 GHz."

For detailed description of each measurement please refer to section testresults.

**DISCOVERY OF WORST CASE MEASUREMENT CONDITION:**

The Permalog Logger is designed for the operation on the fixed transmitter frequency of approx. 463.9 MHz. To find out the worst case conditions for the complete measurement the following tests have been performed:

- Measurement of the radiated fieldstrength of the operating frequency measured in unmodulated transmission mode in the specified channel. This measurement have been performed in order to find out the maximum transmitted fieldstrength of the EuT.
- Measurement of the radiated spurious emissions and frequency error measured in unmodulated transmission mode in the specified channel. This measurement have been performed in order to find out the maximum spurious emissions of the Eut.
- Measurement of the bandwidth under extreme conditions measured in modulated transmission mode in the specified channel.

Based on this testresults, the measurements have been performed completely on the specified channel. This testresults are documented in the following sections of the testreport.

**Description of Measurement**

The final level, expressed in dB $\mu$ V, is arrived at by taking the reading directly from the EMI receiver. This level is compared directly to the FCC Limit or to the CISPR limit, which is equivalent to the Australian AS 3548 limit.

To convert between dB $\mu$ V and  $\mu$ V, the following conversions apply:

$$\text{dB}\mu\text{V} = 20(\log \mu\text{V})$$

$$\mu\text{V} = \text{Inverse log}(\text{dB}\mu\text{V}/20)$$

Conducted emissions on the 50 Hz and/or 60 Hz power interface of the EUT are measured in the frequency range of 150 kHz to 30 MHz. The measurements are performed using a receiver, which has CISPR characteristic bandwidth and quasipeak detection, and a Line Impedance Stabilization Network (LISN), with 50 $\Omega$ /50  $\mu$ H (CISPR 16) characteristics. Table top equipment is placed on a non-conducting table 80 centimeters above the floor and is positioned 40 centimeters from the vertical ground plane (wall) of the screen room. If the minimum passing margin appears to be less than 20 dB with a peak mode measurement, the emissions are remeasured using a tuned receiver with quasipeak and average detection and recorded on the data sheets.

**SPURIOUS EMISSION**

Spurious emissions from the EUT are measured in the frequency range of 9 kHz to 30 MHz using a tuned receiver and a shielded loop antenna. The antenna was positioned 3, 10 or 30 meters horizontally from the EUT. Measurements have been made in all three orthogonal axes and the shielded loop antenna was rotated to locate the maximum of the emissions.

Spurious emissions from the EUT are measured in the frequency range of 30 MHz to 10 times the highest used frequency using a tuned receiver and appropriate broadband linearly polarized antennas. Measurements between 30 MHz and 1000 MHz are made with 120 kHz/6 dB bandwidth and quasipeak detection and measurements above 1000 MHz are made with a 1 MHz/6 dB bandwidth and peak detection, remeasurement of results which may be critical will be repeated in average mode. Table top equipment is placed on a 1.0 X 1.5 meter non-conducting table 80

**File No. T 19197-1-00 MN, Page 7 of 21**

## FCC ID: MJCPERMALOG

centimeters above the ground plane. Floor standing equipment is placed directly on the turntable/ground plane. Interface cables that are closer than 40 centimeters to the ground plane are bundled in the center in a serpentine fashion so they are at least 40 centimeters from the ground plane. Cables to simulators/testers (if used in this test) are routed through the center of the table and to a screen room located outside the test area. The antenna was positioned 3, 10 or 30 meters horizontally from the EUT. To locate maximum emissions from the test sample the antenna is varied in height from 1 to 4 meters, measurement scans are made with both horizontal and vertical antenna polarizations and the EUT are rotated 360 degrees.

### **SPURIOUS EMISSION (MAGNETIC FIELD) 10 kHz - 30 MHz**

|                         |

- o - in a testdistance of 30 meters.

For TEST EQUIPMENT USED please refer to ATTACHMENT B: \_\_\_\_\_

### **Description of Measurement**

The final level, expressed in dB $\mu$ V/m, is arrived at by taking the reading from the EMI receiver (Level dB $\mu$ V) and adding the antenna correction factor and cable loss factor (Factor dB) to it. This result then has to be compared with the relevant FCC limit.

Example:

| Frequency<br>(MHz) | Level<br>(dB $\mu$ V) | + | Factor<br>(dB) | = | Level<br>(dB $\mu$ V/m) | Limit<br>(dB $\mu$ V/m) | = | Delta<br>(dB) |
|--------------------|-----------------------|---|----------------|---|-------------------------|-------------------------|---|---------------|
| 1.705              | 5                     | + | 20             | = | 25                      | 30                      | = | 5             |

**Description of Measurement**

The final level, expressed in dBµV/m, is arrived by taking the reading from the EMI receiver (Level dBµV) and adding the correction factors and cable loss factor (Factor dB) to it. This is done automatically in the EMI receiver, where the correction factors are stored. This result then has the FCC or CISPR limit subtracted from it to provide the Delta which gives the tabular data as shown in the data sheets at page 24 - 25. The CISPR 22 limit is equivalent to the Australian AS 3548 limit.

Example:

|                    |                 |   |                |   |                   |                   |   |               |
|--------------------|-----------------|---|----------------|---|-------------------|-------------------|---|---------------|
| Frequency<br>(MHz) | Level<br>(dBµV) | + | Factor<br>(dB) | = | Level<br>(dBµV/m) | Limit<br>(dBµV/m) | = | Delta<br>(dB) |
| 719                | 75              | + | 32.6           | = | 107.6             | 110               | = | -2.4          |

## Description of Measurement

The conducted power of the fundamental wave measured on the antenna terminals in a climatic test chamber. The antenna jack was connected to the input of a communication test receiver. The internal batteries have been removed also and a variable DC power supply was used instead. The measurements have been made with the EUT unmodulated. During the test the supply voltage and the temperature were varied and applied simultaneously. The lower supply voltage was given by the manufacturer. In case the equipment was switching off before, the switch off voltage was used instead.

**Description of Measurement**

The frequency error was measured with antenna jack in a climatic test chamber. The antenna jack was connected to the input of a communication test receiver. The internal batteries have been removed also and a variable DC power supply was used instead. The measurements have been made with the EUT unmodulated. During the test the supply voltage and the temperature were varied and applied simultaneously. The lower supply voltage was given by the manufacturer. In case the equipment was switching off before, the switch off voltage was used instead. The frequency error is defined as the deviation of the transmitting frequency from the nominal frequency.

For TEST EQUIPMENT USED please refer to ATTACHMENT B: EM \_\_\_\_\_

**Description of Measurement**

The keeping of the requirements of the emission mask was measured with an antenna jack in Climatic test chamber. The antenna jack was connected to the input of a spectrum analyzer. The spectrum analyzer was set up as following:

- video and resolution bandwidth: 10 kHz
- attenuation: automatic, low noise
- center frequency: nominal transmit frequency
- frequency span: 100 kHz

The reference level was set to the maximum value of the unmodulated carrier. The internal batteries have been removed also and a variable DC power supply was used instead. The measurements have been made with a modulation frequency and voltage accdg. to the specification of the manufacturer. During the test the supply voltage and the temperature were varied and applied simultaneously. The lower supply voltage was given by the manufacturer. In case the equipment was switching off before, the switch off voltage was used instead.

**Testresult**

The requirements are

■ - MET

0 - NOT MET

The **requirements** are as following:

Attenuation on any frequencies removed from the transmit frequency  
between 50 and 100 % of the authorized bandwidth: at least 25 dB  
between 100 and 250 % of the authorized bandwidth: at least 35 dB  
more than 250 % of the authorized bandwidth: see spurious emissions

# FCC ID: MJCPERMALOG

The following table is showing the minimal margin to the required attenuations:

| Temperatur / °C | DC supply voltage/V | ±50-100% [dB] | ±100-250% [dB] | ±50-100% [dB] | ±100-250% [dB] | ±50-100% [dB] | ±100-250% [dB] |

|                 | 3.0                 | > 5           | > 10           |               |                |               |                |
| 50              | 3.6                 | > 5           | > 10           |               |                |               |                |
|                 | 3.0                 | > 5           | > 10           |               |                |               |                |

Remarks:     The limit is kept. The attenuation is related to the un-  
                   modulated carrier. For plot see page A5-A22.

## EQUIPMENT UNDER TEST

**Operation - mode of the EUT.:**

The equipment under test was operated during the measurement under following conditions:

- o - Standby
- o - Testprogram (H - Pattern)
- o - Testprogram (color bar)
- o - Testprogram (customer specific)
- - Transmit (unmodulated)(for radiated measurements and frequency error)
- - Transmit (modulated)(for bandwidth under extreme conditions  
measurements)

**Configuration of the equipment under test:** see appendix

Following periphery devices and interface cables were connected during the measurement:

- |   |                                                  |              |
|---|--------------------------------------------------|--------------|
| 0 | - _____                                          | Type : _____ |
| 0 | - _____                                          | Type : _____ |
| 0 | - _____                                          | Type : _____ |
| 0 | - _____                                          | Type : _____ |
| 0 | - _____                                          | Type : _____ |
| 0 | - _____                                          | Type : _____ |
| 0 | - unshielded power cable                         |              |
| 0 | - unshielded cables                              |              |
| 0 | - shielded cables                                | MPS.No. :    |
| 0 | - customer specific cables (wireless microphone) |              |
| ■ | - no cables _____                                |              |
| 0 | - _____                                          |              |

## SUMMARY

### GENERAL REMARKS:

### FINAL JUDGEMENT:

The requirements according to the technical regulations and tested operation modes are

■ - met.

o - **not** met.

The equipment under test

■ - **Fulfills** the general approval requirements cited on page 3.

o - **Does not** fulfill the general approval requirements cited on page 3.

Date of receipt of test sample : accdg. to storage record

Testing Start Date : December 08, 1999

Testing End Date : January 18, 2000
