SUBJECT: ADI FCCID: MKDAR447

REFERENCE: EA94026

The unit was tested with a tuned dipole antenna connected to the unit. I tested the unit scanning and in the single frequency mode. In the single frequency mode I tuned the dipole to the frequency that the UUT was tuned to. In the scanning mode I adjusted the antenna at the center of the band that I was scanning.

The unit was tested with and antenna connected, NOT a termination load.

The UUT cannot tune to any other frequencies than the 430-470MHz and could not easily be modified. Do you need some kind of statement from the manufacturer?

I have asked the manufacturer to clarify the frequency range, I tested the range that the sample would and assumed that was the correct range. When the report was typed I guess that the range from the manual was picked up. I will clarify this up as soon as I hear from the maker.

BEST REGARDS,

Sid Sanders
