Re: response to evaluation report R0307211, question #5

We have measured the distance to the antenna both from the base to the closest point of the antenna on two of the thinnest laptops available, namely the Sony Vaio and the Toshiba Portege.

On both models, due to the normally recommended and published configuration and due to the more conveniently expected user location during reasonable and normal use, the device antenna would be at least 20 cm from the body.
