## 1.0 ADMINISTRATIVE DATA

### 1.1 Certifications and Qualifications

I certify that DNB Engineering, Inc conducted the tests performed in order to obtain the technical data presented in this application. Also, based on the results of the enclosed data, I have concluded that the equipment tested meets or exceeds the requirements of the Rules and Regulations governing this application.

### 1.2 Measurement Repeatability Information

The test data presented in this report has been acquired using the guidelines set forth in FCC Part 2.1031 through 2.1057, Part 15. The test results presented in this document are valid only for the equipment identified herein under the test conditions described. Repeatability of these test results will only be achieved with identical measurement conditions. These conditions include: The same test distance, EUT Height, Measurement Site Characteristics, and the same EUT System Components. The system must have the same Interconnecting Cables arranged in identical placement to that in the test set-up, with the system and/or EUT functioning in the identical mode of operation (i.e. software and so on) as on the date of the test. Any deviation from the test conditions and the environment on the date of the test may result in measurement repeatability difficulties.

All changes made to the EUT during the course of testing as identified in this test report must be incorporated into the EUT or identical models to ensure compliance with the FCC regulations.

Preliminary scans were performed to determine worst case modulation, packet length, and data rates. Only worst case data has been recorded within the body of the test report.

## 1.5 Measurement Uncertainty

| <b>Measurement Type</b>   | <b>Uncertainty</b> |
|---|--------------------|
| AC Conducted Emissions  | N/A                |
| OATS - Radiated Emissions - Vertical Biconical (30-300MHz)        | ± 4.17 dB          |
| OATS - Radiated Emissions - Horizontal Biconical (30-300MHz)      | ± 4.22 dB          |
| OATS - Radiated Emissions - Vertical Log Periodic (300-1000MHz)   | ± 4.92 dB          |
| OATS - Radiated Emissions - Horizontal Log Periodic (300-1000MHz) | ± 4.79 dB          |
| OATS - Radiated Emissions - Vertical DRG Horn (> 1GHz)            | ± 5.74 dB          |
| OATS - Radiated Emissions - Horizontal DRG Horn (>1GHz)           | ± 5.80 dB          |
| Antenna Conducted Measurements                                    | ± 1.96 dB          |

2.1033 (b) (1) Application for Certification

Name of Applicant: Orbit Irrigation Products Inc.  
845 N. Overland Rd.  
West North Salt Lake, UT 84054

FRN Number: 0023422009  
IC Number: 3330A

Name of Manufacturer : Edwin McAuley Electronics Limited  
8/F, Block C, Seaview Estate  
2-8 Watson Road, North Point, Hong Kong

Description: Irrigation Timer with BLE Transmitter

Model Number(s): BH1

Transmitter HVIN: BH1

Anticipated Production Quantity: Multiple Units

Frequency Band: 2402 - 2480 MHz

Rated Power: -0.530 dBm ( 0.855 mW)

Type of Signal: Digital Transmission System (DTS)

Channels: 40 (BLE)

Max Data Rate: 1Mbps (mega-bit) - Data transmission is not continuous, it happens for short intervals for short periods of time.

Antenna Type: Monopole (PWB Trace)

Antenna Gain: 2dBi

Firmware/Software Version: CSR uEnergy SDK 2.6.2.9

2.1033 (b) (2) FCC Identifier

Model Number: BH1  
FCC ID: ML6-BH1  
IC ID: 3330A-BH1  
HVIN: BH1

Figure 1 - Label

2.1033 (b) (3) Installation and Operating Instructions

Supplied separately.

## 2.1033 (b) (4) Brief Description of Circuit Function

### HT 25 /BH1 Theory of Operation:

The BH1 is a small wireless Hub that bridges the wireless communication from a cloud server to wireless enabled sensors and end devices such as the wireless hose tap timer (HT25). From the BH1 hub, the connection to the cloud is through WiFi and the connection to the end devices is over Bluetooth Low Energy (BLE). The communication to and from the HT25 includes SMART watering communication which utilizes enhanced EPA water smart logic, basic programming, and flow data. The HT25 can be used with the BH1 acting as a hub to the servers or it can be used by connecting directly to a smart phone via BLE.

The HT25 is powered by two internal AA batteries. The BH1 is powered by a 5 volt wall transformer. There are no other cables and or interfaces. The HT25 can be programmed using a smart phone app or a web app.

Using the APP, the consumer is then able to configure the product programming by entering key yard or area characteristics, soil type and slope, area photos and other setup parameters. The consumer will then indicate a desired watering pattern or utilize a SMART watering recommendation. The HT25 is can also manually water by using the single button interface at the device.

BH1 is capable of both BLE and WiFi communication. However, only one transmitter can function at any time. This is controlled through the espressif uP which disables the BLE processor from transmitting when WiFi communication is initiated.

### Antenna Requirement

An intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device. The use of a permanently attached antenna or of an antenna that uses a unique coupling to the intentional radiator shall be considered sufficient to comply with the provisions of this section. The manufacturer may design the unit so that a broken antenna can be replaced by the user, but the use of a standard antenna jack or electrical connector is prohibited. This requirement does not apply to carrier current devices or to devices operated under the provisions of §15.211, §15.213, §15.217, §15.219, or §15.221. Further, this requirement does not apply to intentional radiators that must be professionally installed, such as perimeter protection systems and some field disturbance sensors, or to other intentional radiators which, in accordance with §15.31(d), must be measured at the installation site. However, the installer shall be responsible for ensuring that the proper antenna is employed so that the limits in this part are not exceeded.

Pass - Antenna gain is less than 2dBi

Pass - The antenna is part of the pwb and is permanently attached within the device and can not be replaced by the user.

Test Procedure: As specified in ANSI C63.10-2013

To measure conducted emissions, the EUT was set upon a wooden table in the shielded enclosure. AC power was fed into the EUT from the Artificial Mains Network. With the Artificial Mains Network connected to an Rhode & Schwarz FSV Signal and Spectrum Analyzer, and using Personal Computer with TILES Measurement Software, the spectrum was searched from 0.15 - 30 MHz for emissions emanating from the EUT.

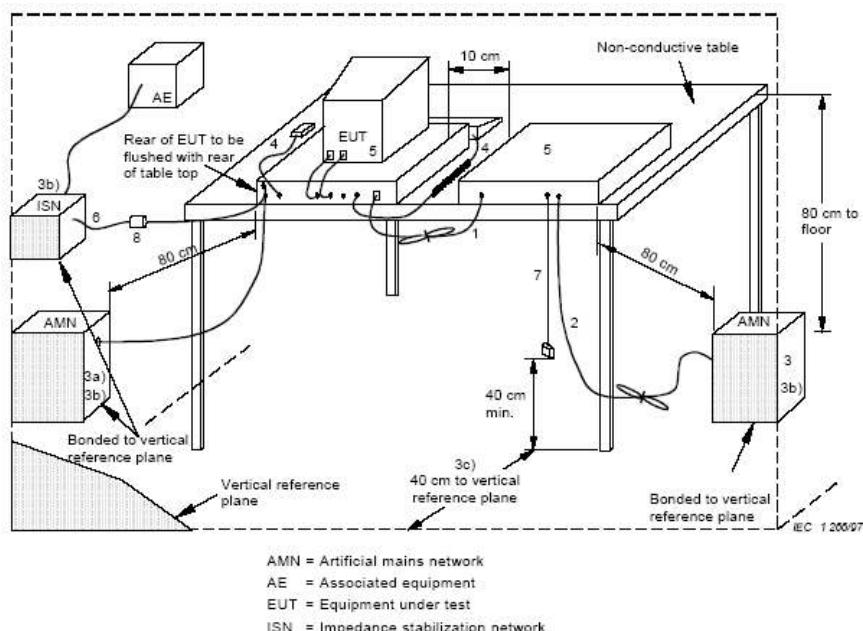

| Frequency of emission<br>(MHz) | Conducted Limit (dBuV) |           |
|--------------------------------|------------------------|-----------|
|                                | Quasi-Peak             | Average   |
| 0.15 - 0.5                     | 66 to 56*              | 56 to 46* |
| 0.5 - 5                        | 56                     | 46        |
| 5 - 30                         | 60                     | 50        |

\* Decreases with the logarithm of the frequency.

#### EUT operating conditions:

The software provided by the client to enable the EUT to transmit continuously.

## Radiated Emissions (General Provisions)

Test Procedure: ANSI C63.10-2013

The EUT was measured on an open area test site (OATS).

A measuring distance of at least 3 m shall be used for measurements at frequencies up to 1 GHz. For frequencies above 1 GHz, any suitable measuring distance may be used. The equipment size (excluding the antenna) shall be less than 20 % of the measuring distance.

Sufficient precautions shall be taken to ensure that reflections from extraneous objects adjacent to the site do not degrade the measurement results, in particular:

- no extraneous conducting objects having any dimension in excess of a quarter wavelength of the highest frequency tested shall be in the immediate vicinity of the site;
- all cables shall be as short as possible; as much of the cables as possible shall be on the ground plane or preferably below; and the low impedance cables shall be screened.
- EUT was positioned in three orthogonal axis - only the worst case data (X-Axis) has been recorded

The EUT shall be placed upon a non-conductive table (wooden for below 1GHz and styrene above 1GHz) 0.80 meters above the ground plane for frequencies from 30 to 1000MHz and 1.5 meters above the ground plane above 1 Ghz and shall be placed in the “worst case” transmitting mode. The EUT shall be rotated 360 degrees to find the azimuth maxima. The receive antenna shall then be raised and lowered between 1 to 4 meters to find the maximum signal emanating from the EUT. This signal strength is then recorded on the data sheets.

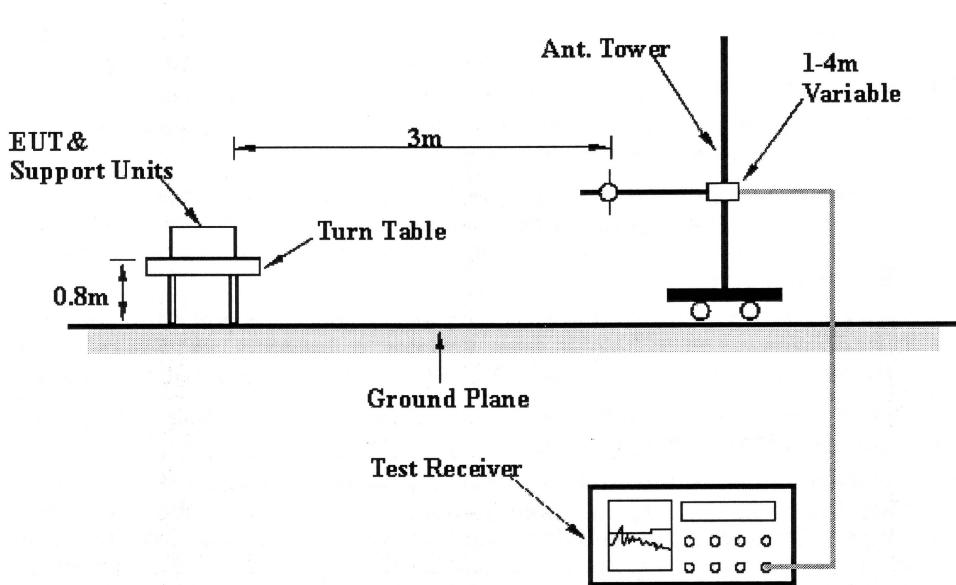

| Frequency (MHz) | Field Strength (uV/m) | Field Strength (dBuV/m)                     | Measurement Distance (meters) |
|-----------------|-----------------------|---|-------------------------------|
| .0009 - 0.490   | 2400/F(kHz)           | $20*(\text{Log}_{10}(2400/F(\text{kHz})))$  | 300                           |
| 0.490 - 1.705   | 24000/F(kHz)          | $20*(\text{Log}_{10}(24000/F(\text{kHz})))$ | 30                            |
| 1.705 - 30.0    | 30                    | 29.5  | 30                            |
| 30 - 88         | 100                   | 40.0  | 3                             |
| 88 - 216        | 150                   | 43.5  | 3                             |
| 216 - 960       | 200                   | 46.0  | 3                             |
| Above 960       | 500                   | 54.0  | 3                             |

FAX (435) 336-4436

## Radiated Emissions (General)

This test is required for any spurious emission or modulation product that falls in a Restricted Band, as defined in Section 15.205. It must be performed with the highest gain of each type of antenna proposed for use with the EUT. Use the following spectrum analyzer settings:

Span = wide enough to fully capture the emission being measured  
RBW = 1 MHz for  $f \geq 1$  GHz, 100 kHz for  $f < 1$  GHz  
VBW = RBW  
Sweep = auto  
Detector function = peak  
Trace = max hold

Follow the guidelines in ANSI C63.10-2013 with respect to maximizing the emission by rotating the EUT, measuring the emission while the EUT is situated in three orthogonal planes (if appropriate), adjusting the measurement antenna height and polarization, etc. A pre-amp and a high pass filter are required for this test, in order to provide the measuring system with sufficient sensitivity. Allow the trace to stabilize. The peak reading of the emission, after being corrected by the antenna factor, cable loss, pre-amp gain, etc., is the peak field strength, which must comply with the limit specified in Section 15.35(b). Submit this data.

Now repeat the measurement using the average detector of the spectrum analyzer. Submit this data.

If the emission on which a radiated measurement must be made is located at the edge of the authorized band of operation, then the alternative “marker-delta” method, listed at the end of this document, may be employed.

Note 1: Limit listed is the general limit as specified in 15.209 in order to show compliance with the restricted bands of operation as well as the out of band limit in 15.247. No other identifiable signals were observed in the restricted bands as specified in 15.205.

Note 2: Highest frequency investigated was the tenth harmonic of the fundamental, no radiated emissions were detected above the 3rd harmonic.

### Radiated Corrected Band Edge - Upper Edge - Z Axis - Vertical

15.247 (a,2)      6 dB Bandwidth

Test Procedure:      ANSI C63.10-2013

6 dB Bandwidth

Use the following spectrum analyzer settings:

Span = approximately 2 to 3 times the 6 dB bandwidth, centered on a hopping channel

RBW 1% of the 6 dB bandwidth

VBW RBW

Sweep = auto

Detector function = peak

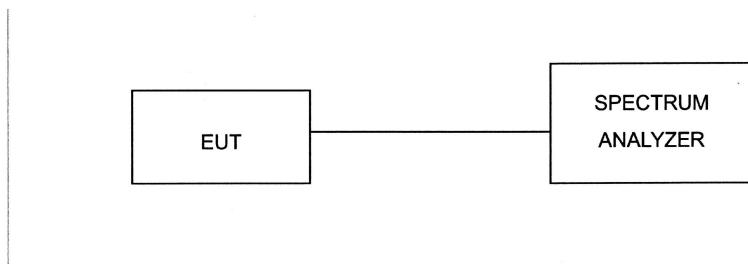

Trace = max hold

The EUT should be transmitting at its maximum data rate. Allow the trace to stabilize. Use the marker-to-peak function to set the marker to the peak of the emission. Use the marker-delta function to measure 6 dB down one side of the emission. Reset the marker-delta function, and move the marker to the other side of the emission, until it is (as close as possible to) even with the reference marker level. The marker-delta reading at this point is the 6 dB bandwidth of the emission. If this value varies with different modes of operation (e.g., data rate, modulation format, etc.), repeat this test for each variation. The limit is specified in one of the subparagraphs of this Section. Submit this plot(s).

EUT operating conditions:

The software provided by the client to enable the EUT to transmit continuously.

Test Set Up: (Note following set up was used for all antenna conducted measurements)
