D. MODULATION CHARACTERISTICS (Continued)

The plots are within the limits imposed by Paragraph 90.211(c) for frequency modulation. The horizontal scale (frequency) is 10 kHz per division and the vertical scale (amplitude) is a logarithmic presentation equal to 10 dB per division.

Resolution bandwidth was 100 Hz; video bandwidth 1 kHz; max store display; 20 second scan time.

E. SPURIOUS EMISSIONS AT THE ANTENNA TERMINALS (Paragraph 2.991 of the Rules)

The 75-440 transmitter was tested for spurious emissions at the antenna terminals while the equipment was modulated with a 2500 Hz signal, 16 dB above minimum input signal for 50% (2.5 kHz deviation) modulation at 2909 Hz, the frequency of highest sensitivity.

Measurements were made with Tektronix 494P spectrum analyzer coupled to the transmitter output terminal through a Narda 765-20 power attenuator. A notch filter was used to attenuate the carrier.

During the tests, the transmitter was terminated in the 50 ohm attenuator. Power was monitored on a Bird 43 Thru-Line wattmeter; dc supply was 7.5 volts throughout the tests.

Spurious emissions were measured at 2.0 and 1.1 watts output throughout the RF spectrum from 12 (lowest frequency generated in the transmitter is 14.4 MHz) to the tenth harmonic of the carrier.

Any emissions that were between the required attenuation and the noise floor of the spectrum analyzer were recorded. Data are shown in Table 1.

F. DESCRIPTION OF RADIATED SPURIOUS MEASUREMENT FACILITIES

A description of the Hyak Laboratories' radiation test facility is a matter of record with the FCC. The facility meets ANSI 63.4-1992 and was accepted for radiation measurements from 25 to 1000 MHz on October 1, 1976 and is currently listed as an accepted site.

TABLE 1
TRANSMITTER CONDUCTED SPURIOUS
460.050, 7.5 Vdc Input

<u>Spurious Frequency MHz</u>	<u>dB Below Carrier Reference</u>	
<u>2.0 W</u>		
920.100	72	
1380.150	95	
1840.200	86	
2300.250	88	
2760.300	>102	
3220.350	>101	
3680.400	>100	
4140.450	>102	
4600.500	>103	
Required:	46	(53) 90.210(d)
<u>1.1 W</u>		
920.100	68	
1380.150	93	
1840.200	86	
2300.250	>100	
2760.300	>100	
3220.350	>101	
3680.400	>102	
4140.450	>102	
4600.500	>102	
Required:	43	(50) 90.210(d)

All other emissions from 14 MHz to the tenth harmonic were 20 dB or more below FCC limit.

*Reference data only, more than 20 dB below FCC limit.

NOTE: Carrier notch filter used to increase dynamic range.

G. FIELD STRENGTH MEASUREMENTS OF SPURIOUS RADIATION

Field intensity measurements of radiated spurious emissions from the 75-440 were made with a Tektronix 494P spectrum analyzer using Singer DM-105A calibrated dipole antennas below 1 GHz, and Polarad CA-L, and CA-S or EMCO 3115 from 1-5.0 GHz.

The transmitter and dummy load were located in an open field 3 meters from the test antenna. Supply voltage was a power supply with a terminal voltage under load of 7.5 Vdc.

Output power was 2.0 watts at 460.050 MHz operating frequency. The transmitter and test antennas were arranged to maximize pickup. Both vertical and horizontal test antennae polarization were employed.

Reference level for the spurious radiations was taken as an ideal dipole excited by 2.0 watts, the output power of the transmitter according to the following relationship:*

$$E = \frac{(49.2P_t)^{1/2}}{R}$$

where E = electric-field intensity in volts/meter
 P_t = transmitter power in watts
 R = distance in meters

$$\text{for this case } E = \frac{(49.2 \times 2.0)^{1/2}}{3} = 3.3 \text{ V/m}$$

Since the spectrum analyzer is calibrated in decibels above one milliwatt (dBm), a conversion, for convenience, was made from dBu to dBm.

$$3.3 \text{ volts/meter} = 3.3 \times 10^6 \text{ uV/m}$$

$$\text{dBu/m} = 20 \log_{10}(3.3 \times 10^6)$$

$$= 130 \text{ dBu/m}$$

Since 1 uV/m = -107 dBm, the reference becomes

$$134 - 107 = 23 \text{ dBm}$$

*Reference Data for Radio Engineers, Fourth Edition, International Telephone and Telegraph Corp., p. 676.

G. FIELD STRENGTH MEASUREMENTS (Continued)

The transmitter and test antennae were arranged to maximize pickup. Both vertical and horizontal test antenna polarization were employed.

The measurement system was capable of detecting signals 95 dB or more below the reference level. Measurements were made from the lowest frequency generated within the unit (14 MHz), to 10 times operating frequency. Data after application of antenna factors and line loss corrections are shown in Table 2.

TABLE 2

Required:	46 (53) 90.210(d)

¹Worst-case polarization, H-Horizontal, V-Vertical.

* Reference data only, more than 20 dB below FCC limit.

All other spurious from 14 MHz to 4.7 GHz were 20 dB or more below FCC limit.

H. FREQUENCY STABILITY

(Paragraph 2.995(a)(2) and 90.213 of the Rules)

Measurement of frequency stability versus temperature was made at temperatures from -30°C to $+50^{\circ}\text{C}$. At each temperature, the unit was exposed to test chamber ambient a minimum of 60 minutes after indicated chamber temperature ambient had stabilized to within $\pm 2^{\circ}$ of the desired test temperature. Following the 1 hour soak at each temperature, the unit was turned on, keyed and frequency measured within 2 minutes. Test temperature was sequenced in the order shown in Table 3, starting with -30°C .

A Thermotron S1.2 temperature chamber was used. Temperature was monitored with a Keithley 871 digital thermometer. The transmitter output stage was terminated in a dummy load. Primary supply was 7.5 volts. Frequency was measured with a HP 5385A frequency counter connected to the transmitter through a power attenuator. Measurements were made at 460.050 MHz. No transient keying effects were observed.

TABLE 3

FREQUENCY STABILITY vs. TEMPERATURE

460.050 MHz; 7.5 Vdc; 2.0 W

<u>Temperature, $^{\circ}\text{C}$</u>	<u>Output Frequency, MHz</u>	<u>p.p.m.</u>
-29.6	460.049965	-0.1
-19.6	460.049849	-0.3
- 9.9	460.050012	0.0
0.0	460.049923	-0.2
9.9	460.049921	-0.2
20.0	460.049883	-0.3
30.5	460.049843	-0.3
40.4	460.049764	-0.5
50.1	460.049807	-0.4
Maximum frequency error:	460.049764	
	<u>460.050000</u>	
	- .000236 MHz	

FCC Rule 90.213(a) specifies .00025% or a maximum of $\pm$.001150 MHz, which corresponds to:

High Limit	460.051150 MHz
Low Limit	460.048850 MHz

I. FREQUENCY STABILITY AS A FUNCTION OF SUPPLY VOLTAGE
(Paragraph 2.995(d)(2) of the Rules)

Oscillator frequency as a function of power supply voltage was measured with a HP 5385A frequency counter as supply voltage provided by an HP 6264B variable dc power supply was varied from $\pm 15\%$ above the nominal 7.5 volt rating. A Fluke 197 digital voltmeter was used to measure supply voltage at transmitter primary input terminals. Measurements were made at 20°C ambient.

TABLE 4

FREQUENCY STABILITY AS A FUNCTION OF SUPPLY VOLTAGE

460.050 MHz, 7.5 Volts Nominal, 2.0 W

$\%$	<u>Supply Voltage</u>	<u>Output Frequency, MHz</u>	<u>p.p.m.</u>
115	8.63	460.049904	-0.2
110	8.25	460.049896	-0.2
105	7.88	460.049888	-0.2
100	7.50	460.049883	-0.3
95	7.13	460.049877	-0.3
90	6.75	460.049873	-0.3
85	6.38	460.049868	-0.3
*	5.8	454.049860	-0.3

Maximum frequency error: 460.049860
460.050000

- .000140 MHz

*MFR rated battery end-point

FCC Rule 90.213(a) specifies .00025% or a maximum of $\pm .001150$ MHz, corresponding to:

High Limit	460.051150 MHz
Low Limit	460.048850 MHz
