Standards:

#### FCC OET Bulletin 65 supplement C, ANSI/IEEE C95.1 , C95.3

In the configuration tested, the EUT complied with the standards specified above. **Remarks**:

This report details the results of the testing carried out on one sample, the results contained in this test report do not relate to other samples of the same product. The manufacturer should ensure that all products in series production are in conformity with the product sample detailed in this report.

This report may only be reproduced and distributed in full. If the product in this report is used in any configuration other than that detailed in the report, the manufacturer must ensure the new system complies with all relevant standards. Any mention of SGS Taiwan E&E Services or testing done by SGS Taiwan E&E Services in connection with distribution or use of the product described in this report must be approved by SGS Taiwan E&E Services in writing.

#### **1.4 Test Environment**

Ambient temperature : 22.2° C

Tissue Simulating Liquid : 21.5° C

Relative Humidity : 52 %

#### 1.5 Operation Configuration

The EUT is PCMCIA Card, which is installed inside a Notebook. Since the Notebook is placed on the top of the leg, when it operates, it is to be defined as a portable device. SAR measurement is mandatory. In order to measure SAR value, we used continuous transmission mode. The test set up mode was prepared by manufacturer. Value of Crest Factor = 1 was used for SAR testing according to the nature of the EUT. The test configuration tested at the low, middle and high frequency channels (2412MHz,2437MHz and 2462MHz).By using the program subordinated in the computer, and change into the written channel, and then set in highest power. Finally, we will test it by dividing into 2 ways.

- Configuration 1: "End-on" placement; Bottom of the Pc is paralleled and at a distance of 0.0 cm from the base of the phantom, but 1.3 cm Spacing between EUT & Planar Phantom. (Fig.3 & Fig.4 & Fig.5)
- Configuration 2: " Edge-on" placement; edge of the PC at 90° and at a distance of 1.5 cm from the base of the phantom. (Fig.6 & Fig.7 & Fig.8)

#### **1.6 EVALUATION PROCEDURES**

The evaluation was performed with the following procedure:

(1). Measurement of the SAR value at a fixed location above the ear point or central position of flat phantom was used as a reference value for assessing the power drop.

- (2). The SAR distribution at the exposed side of head or body position was measured at a distance of each device from the inner surface of the shell. The area covered the entire dimension of the head or EUT and the horizontal grid spacing was 15 mm x 15 mm. Based on these data, the area of the maximum absorption was determined by splint interpolation.
- (3). Around this point, a volume of 30 mm x 30 mm x 30 mm was assessed by measuring 7 x7 x 7 points. On the basis of this data set, the spatial peak SAR value was evaluated under the following procedure:
  - The data at the surface were extrapolated, since the center of the dipoles is 2.7 mm away from the tip of the probe and the distance between the surface and the lowest measuring point is 1.2 mm. The extrapolation was based on a least square algorithm [1]. A polynomial of the fourth order was calculated through the points in z-axes. This polynomial was then used to evaluate the points between the surface and the probe tip.
  - 2. The maximum interpolated value was searched with a straightforward algorithm. Around this maximum the SAR values averaged over the spatial volumes (1 g or 10 g) were computed by the 3D-Spline interpolation algorithm. The 3D-Spline is composed of three one-dimensional splints with the "Not a knot"-condition (in x, y and z-directions) [1], [2]. The volume was integrated with the trapezoidal-algorithm. One thousand points (10 x 10 x 10) were interpolated to calculate the average.
  - 3. All neighboring volumes were evaluated until no neighboring volume with a higher average value was found.
  - 4. Re-measurement of the SAR value at the same location as in Step 1. If the value changed by more than 5%, the evaluation was repeated.

#### 1.7 The SAR Measurement System

A photograph of the SAR measurement System is given in Fig. a. This SAR Measurement System uses a Computer-controlled 3-D stepper motor system (Speag Dasy 4 professional system). A Model ET3DV6 1759 E-field probe is used to determine the internal electric fields. The SAR can be obtained from the equation SAR=  $\sigma$  ( $|Ei|^2$ )/ $\rho$  where  $\sigma$  and  $\rho$  are the conductivity and mass density of the tissue-simulant.

The DASY4 system for performing compliance tests consists of the following items:

• A standard high precision 6-axis robot (Staubli RX family) with controller, teach pendant and software. An arm extension for accommodating the data acquisition electronics (DAE).

- A dosimeter probe, i.e., an isotropic E-field probe optimized and calibrated for usage in tissue simulating liquid. The probe is equipped with an optical surface detector system.
- A data acquisition electronics (DAE) which performs the signal amplification, signal multiplexing, AD-conversion, offset measurements, mechanical surface detection, collision detection, etc. The unit is battery powered with standard or rechargeable batteries. The signal is optically transmitted to the EOC.

Fig. a The microwave circuit arrangement used for SAR system verification

- The Electro-optical converter (EOC) performs the conversion between optical and electrical of the signals for the digital communication to the DAE and for the analog signal from the optical surface detection. The EOC is connected to the measurement server.
- The function of the measurement server is to perform the time critical tasks such as signal filtering, control of the robot operation and fast movement interrupts.
- A probe alignment unit which improves the (absolute) accuracy of the probe positioning.
- A computer operating Windows 2000 or Windows XP.
- DASY4 software.
- Remote control with teach pendant and additional circuitry for robot safety such as

#### Report No. : ER/2003/C0005 Page : 7 of 34

warning lamps, etc.

- The SAM twin phantom enabling testing left-hand and right-hand usage.
- The device holder for handheld mobile phones.
- Tissue simulating liquid mixed according to the given recipes.
- Validation dipole kits allowing to validate the proper functioning of the system.

#### **1.8 System Components**

#### ET3DV6 E-Field Probe

| Construction:  | Symmetrical design with triangular core             |                      |  |  |
|----------------|---|----------------------|--|--|
|                | Built-in shielding against static charges           |                      |  |  |
|                | PEEK enclosure material                             |                      |  |  |
|                | (resistant to organic solvents, e.g. glycol)        |                      |  |  |
| Calibration:   | In air from 10 MHz to 2.5 GHz                       |                      |  |  |

| Frequency:     | 10 MHz to >6 GHz; Linearity: ±0.2 dB                |                      |  |  |
|                | (30 MHz to 3 GHz)                                   | ET3DV6 E-Field Probe |  |  |
| Directivity:   | ±0.2 dB in brain tissue (rotation around pro        | be axis)             |  |  |
|                | ±0.4 dB in brain tissue (rotation normal to p       | probe axis)          |  |  |
| Dynamic Rnge:  | 5 $\mu$ W/g to >100 mW/g; Linearity: ±0.2 dB        |                      |  |  |
| Srfce. Detect: | ±0.2 mm repeatability in air and clear liquids over |                      |  |  |
|                | diffuse reflecting surfaces                         |                      |  |  |
| Dimensions:    | Overall length: 330 mm                              |                      |  |  |
|                | Tip length: 16 mm                                   |                      |  |  |
|                | Body diameter: 12 mm                                |                      |  |  |
|                | Tip diameter: 6.8 mm                                |                      |  |  |
|                | Distance from probe tip to dipole centers: 2.7 mm   |                      |  |  |
| Application:   | General dosimetry up to 3 GHz                       |                      |  |  |
|                | Compliance tests of mobile phone                    |                      |  |  |
|                |   |                      |  |  |

#### SAM PHANTOM V4.0C

Construction: The shell corresponds to the specifications of the Specific Anthropomorphic Mannequin (SAM) phantom defined in IEEE 1528-200X, CENELEC 50361 and IEC 62209. It enables the

Report No. : ER/2003/C0005 Page : 8 of 34

dosimetric evaluation of left and right hand phone usage as well as body mounted usage at the flat phantom region. A cover prevents evaporation of the liquid. Reference markings on the phantom allow the complete setup of all predefined phantom positions and measurement grids by manually teaching three points with the robot.

Shell Thickness: Filling Volume: Dimensions: 2 ± 0.2 mm Approx. 25 liters Height: 810 mm; Length: 1000 mm; Width: 500 mm

PHANTOM v4.0C

#### **DEVICE HOLDER**

Construction

In combination with the Twin SAM Phantom V4.0/V4.0C or Twin SAM, the Mounting Device (made from POM) enables the rotation of the mounted transmitter in spherical coordinates, whereby the rotation point is the ear opening. The devices can be easily and accurately positioned according to IEC, IEEE, CENELEC, FCC or other specifications. The device holder can be locked at different phantom locations (left head, right head, flat phantom).

Device Holder

#### **1.9 SAR System Verification**

The microwave circuit arrangement for system verification is sketched in Fig. b. The daily system accuracy verification occurs within the flat section of the SAM phantom. A SAR measurement was performed to see if the measured SAR was within +/- 10% from the target SAR values. These tests were done at 2450MHz. The tests were conducted on the

#### Report No. : ER/2003/C0005 Page : 9 of 34

same days as the measurement of the DUT. The obtained results from the system accuracy verification are displayed in the table 1 (SAR values are normalized to 1W forward power delivered to the dipole). During the tests, the ambient temperature of the laboratory was in the range 22.3 °C, the relative humidity was in the range 54% and the liquid depth above the ear reference points was above 15 cm in all the cases. It is seen that the system is operating within its specification, as the results are within acceptable tolerance of the reference values.

The composition of the brain tissue simulating liquid for 2450 MHz is:

| Ingredient   | 2450Mhz (Head) | 2450Mhz (Body) |
|--------------|----------------|----------------|
| DGMBE        | 550.0 g        | 301.7 ml       |
| Water        | 450.0 g        | 698.3 ml       |
| Total amount | 1 L (1.0kg)    | 1 L (1.0kg)    |

#### 1.11 Test Standards and Limits

According to FCC 47CFR §2.1093(d) The limits to be used for evaluation are based generally on criteria published by the American National Standards Institute (ANSI) for localized specific absorption rate ("SAR") in Section 4.2 of "IEEE Standard for Safety Levels with Respect to Human Exposure to Radio Frequency Electromagnetic Fields, 3 kHz to 300 GHz," ANSI/IEEE C95.1–1992, Copyright 1992 by the Institute of Electrical and Electronics Engineers, Inc., New York, New York 10017. These criteria for SAR evaluation are similar to those recommended by the National Council on Radiation Protection and Measurements (NCRP) in "Biological Effects and Exposure Criteria for Radiofrequency Electromagnetic Fields," NCRP Report No. 86, Section 17.4.5. Copyright NCRP, 1986, Bethesda, Maryland 20814. SAR is a measure of the rate of energy absorption due to exposure to an RF transmitting source. SAR values have been related to threshold levels for potential biological hazards. The criteria to be used are specified in paragraphs (d)(1) and (d)(2) of this section and shall apply for portable devices transmitting in the frequency range from 100 kHz to 6 GHz. Portable devices that transmit at frequencies above 6 GHz are to be evaluated in terms of the MPE limits specified in § 1.1310 of this chapter. Measurements and calculations to demonstrate compliance with MPE field strength or power density limits for devices operating above 6

Report No. : ER/2003/C0005 Page : 11 of 34

GHz should be made at a minimum distance of 5 cm from the radiating source. (1) Limits for Occupational/Controlled exposure: 0.4 W/kg as averaged over the whole-body and spatial peak SAR not exceeding 8 W/kg as averaged over any 1 gram of tissue (defined as a tissue volume in the shape of a cube). Exceptions are the hands, wrists, feet and ankles where the spatial peak SAR shall not exceed 20 W/kg, as averaged over an 10 grams of tissue (defined as a tissue volume in the shape of a cube). Occupational/Controlled limits apply when persons are exposed as a consequence of their employment provided these persons are fully aware of and exercise control over their exposure. Awareness of exposure can be accomplished by use of warning labels or by specific training or education through appropriate means, such as an RF safety program in a work environment.

(2) Limits for General Population/Uncontrolled exposure: 0.08 W/kg as averaged over the whole-body and spatial peak SAR not exceeding 1.6 W/kg as averaged over any 1 gram of tissue (defined as a tissue volume in the shape of a cube). Exceptions are the hands, wrists, feet and ankles where the spatial peak SAR shall not exceed 4 W/kg, as averaged over any 10 grams of tissue (defined as a tissue volume in the shape of a cube). General Population/Uncontrolled limits apply when the general public may be exposed, or when persons that are exposed as a consequence of their employment may not be fully aware of the potential for exposure or do not exercise control over their exposure. Warning labels placed on consumer devices such as cellular telephones will not be sufficient reason to allow these devices to be evaluated subject to limits for occupational/controlled exposure in paragraph (d)(1) of this section.(Table .4)

| Human Exposure                               | Uncontrolled Environment<br>General Population | Controlled Environment<br>Occupational |
|--|--|--|
| Spatial Peak SAR<br>(Brain)                  | 1.60 m W/g                                     | 8.00 m W/g                             |
| Spatial Average SAR<br>(Whole Body)          | 0.08 m W/g                                     | 0.40 m W/g                             |
| Spatial Peak SAR<br>(Hands/Feet/Ankle/Wrist) | 4.00 m W/g                                     | 20.00 m W/g                            |

Table .4 RF exposure limits

Notes:

1. Uncontrolled environments are defined as locations where there is potential exposure of individuals who have no knowledge or control of their potential exposure.

2. Controlled environments are defined as locations where there is potential exposure of individuals who have knowledge of their potential exposure and can exercise control over their exposure.

## 3. Summary of Results

The measurement results were obtained with the EUT tested in the conditions described in this report. Detailed measurement data and plots showing the maximum SAR location of the EUT are reported in 4.Measurements

# Probe ET3DV6

## SN:1759

Manufactured: Last calibration: November 12, 2002 March 7, 2003

#### Calibrated for DASY Systems

(Note: non-compatible with DASY2 system!)

Page 1 of 10

Report No. : ER/2003/C0005 Page : 30 of 34

### Isotropy Error ( $\phi$ ), $\theta = 0^{\circ}$

#### **Phantom description**

## Schmid & Partn Engineering AG

Zaughausstrasse 43, 8004 Zurich, Switzerland, Phone +41 1 245 97 00, Fax +41 1 245

#### Certificate of conformity / First Article Inspection

| Item .    | SAM Twin Phantom V4.0  |   |
|-----------|--|---|
| Type No   | QD 000 P40 CA  |   |
| Series No | TP-1150 and higher   | 3 |
| 1         | Untersee Composites<br>Hauptstr. 69<br>CH-8559 Fruthwilen<br>Switzerland |   |

#### Tests

ì

The series production process used allows the limitation to test of first articles. Complete tests were made on the pre-series Type No. QD 000 P40 AA, Serial No. TP-1001 and on the series first article Type No. QD 000 P40 BA, Serial No. TP-1006. Certain parameters have been retested using further series units (called samples).

|   |   | Details  | Units tested                   |
|---|---|--|--------------------------------|

| Material resistivity                      | The material has been tested to be<br>compatible with the liquids defined in<br>the standards | Liquid type HSL 1800   | Pre-series,<br>First article   |

#### Standards

CENELEC EN 50361

IEEE P1528-200x draft 6.5

\*IEC PT 62209 draft 0.9

The IT'IS CAD file is derived from [2] and is also within the tolerance requirements of the shapes of [1] and [3].

#### Conformity

Based on the sample tests above, we certify that this item is in compliance with the uncertainty requirements of SAR measurements specified in standard [1] and draft standards [2] and [3].
