TEST PROCEDURE (CONT)

RADIATION INTERFERENCE: The test procedure used was ANSI STANDARD C63.4-1992 using a HEWLETT PACKARD spectrum analyzer with a preselector. The bandwidth of the spectrum analyzer was 100 kHz with an appropriate sweep speed. The analyzer was calibrated in dB above a microvolt at the output of the antenna. The resolution bandwidth was 100KHz and the video bandwidth was 300KHz. The ambient temperature of the UUT was 77oF with a humidity of 60%.

ANSI STANDARD C63.4-1992 10.1.7 MEASUREMENT PROCEDURES: The UUT was placed on a table 80 cm high and with dimensions of 1m by 1.5m. The UUT was placed flush with the back of the table (1.5m side). The table used for radiated measurements is capable of continuous rotation.

When an emission was found, the table was rotated to produce the maximum signal strength. At this point, the antenna was raised and lowered from 1m to 4m. The antenna was placed in both the horizontal and vertical planes.

The situation was similar for the conducted measurement except that the table did not rotate. The EUT was setup as described in ANSIC63.4-1992 with the EUT 40 cm from the vertical ground wall.

FORMULA OF CONVERSION FACTORS: The Field Strength at 3m was established by adding the meter reading of the spectrum analyzer (which is set to read in units of dBuV) to the antenna correction factor supplied by the antenna manufacturer. The antenna correction factors are stated in terms of dB. The gain of the Preselector was accounted for in the Spectrum Analyzer Meter Reading.

Example:

Freq (MHz)	METER READING + ACF = FS
33	20 dBuV + 10.36 dB = 30.36 dBuV/m @ 3m

POWER LINE CONDUCTED INTERFERENCE: The procedure used was ANSI STANDARD C63.4-1992 using a 50uH LISN. Both lines were observed. The bandwidth of the spectrum analyzer was 10kHz with an appropriate sweep speed. The ambient temperature of the UUT was 77oF with a humidity of 60%.

CIRCUIT DESCRIPTION:

BASE UNIT

The incoming signal comes in on the antenna and is fed through the duplexer to the LNA, Q500 and then to a SAW bandpass filter, FL501. The frequency range of the base receiver is 926-928MHz. From the bandpass filter the signal is fed to the mixer, Q501 which converts the signal down to 26.05MHz. From Q501 the signal is fed to the IF filter FL502 and then to the integrated circuit U500. In the U500 the signal is converted down to 450KHz and then to the detector for FM signal. From the detector the audio is fed to a low pass filter and to the Channel Detector Indicator. From the low pass filter the audio is fed into another low pass filter and shaper and then to the CPU, U311. From the CPU, U311, the audio is fed to a speaker amplifier and the telephone line depending which is selected. From the CPU the line audio is fed to U305A and then to U305B then to the telephone coupling transformer, T301. The CPU also compares the SECURITY CODES and provides the outgoing SECURITY CODE.

On the transmitting side, when a ring signal is detected the transmitter is turned on by photo coupler integrated circuit U301 and the ring detect signal is fed into the CPU, U306, which in turn triggers the transmitter and send a ring signal to the handset. The base transmit frequency range is 902-904MHz. When the handset answers the base unit connects to the phone line and telephone line audio is fed into the speech network and then to an audio amplifier, Q304. The audio is then fed into the compressor U311. From U311 the audio is fed into the VCO, VT which modulated the outgoing carrier. From the VCO the signal is fed through a series of amplifiers, Q508 & Q509. From Q508 the signal is fed to the antenna.

CIRCUIT DESCRIPTIONS CONTD.

HANDSET

The incoming signal comes in on the antenna and is fed through the duplexer to the LNA, Q100 and then to a SAW 903MHz bandpass filter. The frequency range of the handset receiver is 902-904MHz. From the bandpass filter the signal is fed to the mixer, Q101 which converts the signal down to 26.05MHz. From Q101 the signal is fed to the IF filter FL102 and then to the integrated circuit U100. In the U100 the signal is converted down to 450KHz and then to the detector for FM signal. From the detector, p/o U100 the audio is fed to a low pass filter and to the RING Detector Indicator. From the low pass filter the audio is fed simultaneously to the earphone element and to the CPU, U101. The earphone audio is fed into U2 and then to U4 then to the receiver element, RC1. The CPU uses the data to continuously monitor the security code.

The transmitter frequency range is 926-928MHz. The outgoing audio is picked up by the microphone and fed to the audio integrated circuit U2. This audio integrated circuit feeds a low pass filter then feeds the signal to the VCO, VT. From the VCO the signal is fed in to the amplifier Q107 and Q108 to the duplexer and then to the antenna.

ANTENNA AND GROUND CIRCUITRY

This unit makes use of a short, antenna. The antenna is inductively coupled. The antenna is self contained, no provision is made for an external antenna.

No ground connection is provided. The unit relies on the ground track of the printed circuit board.

NAME OF TEST: Occupied Bandwidth
RULES PART NO.: 15.233
REQUIREMENTS: The field strength of any emissions appearing between the band edges and up to 10 kHz above and below the band edges shall be attenuated at least 26 dB below the level of the unmodulated carrier or to the general limits of 15.209, whichever permits the higher emission levels.

THE GRAPHS IN EXHIBITS REPRESENT THE EMISSIONS TAKEN FOR THIS DEVICE.

METHOD OF MEASUREMENT: A small sample of the transmitter output was fed into the spectrum analyzer and the above photo was taken. The vertical scale is set to -10 dBm per division. The horizontal scale is set to 5 kHz per division.

TEST RESULTS: The unit DOES meet the FCC requirements.
