Dr. Joseph Brunett, EMC-002790-NE

Report Approved by:

Dr. Joseph Brunett, EMC-002790-NE

Report by:

Dr. Joseph Brunett, EMC-002790-NE

Report Date of Issue:

February 28, 2011

Results of equipment under test (EUT) testing completed before February 28, 2011 are as follows.

**Emissions** The transmitter fundamental emission meets the regulatory limit(s) by no less than 8.3 dB. Transmit chain spurious harmonic emissions comply by no less than 8.2 dB.

## 1.2 Test Location and Equipment Used

**Test Location** The EUT was fully tested at **Willow Run Test Labs, LLC**, 8501 Beck Road, Building 2227, Belleville, MI 48111. The site description and attenuation characteristics of the Open Area Test Site are on file with the FCC Laboratory, Columbia, Maryland (FCC Reg. No: 688478) and with Industry Canada, Ottawa, ON (File Ref. No: IC 8719A-1).

**Test Equipment** Pertinent test equipment used for measurements at this facility is listed in Table 1. The quality system employed at Willow Run Test Labs, LLC has been established to ensure all equipment has a clearly identifiable classification, calibration expiry date, and that all calibrations are traceable to the SI through NIST, other recognized national laboratories, accepted fundamental or natural physical constants, ratio type of calibration, or by comparison to consensus standards.

# 2 Configuration and Identification of the Equipment Under Test

# 2.1 Description and Declarations

The EUT is a wireless tire pressure and temperature sensor. The equipment under test (EUT) is approximately  $3.55 \times 3.8 \times 1.7$  cm in dimension, and is depicted in Figure 1. It is powered by a 3 VDC Lithium cell battery. In use, this device is permanently affixed as the valve-stem in the tire of a motor vehicle. Table 2 outlines provider declared EUT specifications.

Figure 1: Photographs of the EUT.

Table 2: EUT Declarations

| General Declarations |                        |                     |   |

# 2.1.1 EUT Configuration

The EUT is configured for testing as depicted in Figure 2.

Schrader Electronics GM Opel FCC ID: MRXGME54A4 IC: 2546A-GME54A4 PN: 13354312

Figure 2: EUT test configuration diagram.

Prepared For: Schrader Electronics

## 2.1.2 Modes of Operation

Date of Issue: February 28, 2011

The EUT is capable of three key modes of operation. Upon manually activated LF interrogation (through the use of special LF tool at a vehicle dealership), the EUT responds with a singe transmission containing a number of frames at 433.9 MHz, and turns off in less than 5 seconds. When the EUT is placed in the vehicle tire and the vehicle drives, it can, in the worst case, periodically transmit a set of data frames once every 33.5 seconds. In the case of an emergency condition, the EUT will transmit tire pressure and temperature information throughout the duration of the condition.

#### 2.1.3 Variants

There is only a single variant of the EUT, and the worst case configuration was tested.

### 2.1.4 Test Samples

One normal operating sample, one CW capable sample, and one un-potted sample were provided for testing and photographs.

#### 2.1.5 Functional Exerciser

Normal EUT functionality was confirmed by observing transmitted data on the spectrum analyzer when the EUT was LF interrogated using an associated LF tool or shaken to produce driving mode periodic transmissions.

#### 2.1.6 Modifications Made

There were no modifications made to the EUT by this laboratory.

#### 2.1.7 Production Intent

The EUT appears to be a production ready sample.

### 2.1.8 Declared Exemptions and Additional Product Notes

The EUT is permanently installed in a transportation vehicle. As such, digital emissions are exempt from US and Canadian digital emissions regulations (per FCC 15.103(a) and IC correspondence on ICES-003).

The EUT also employs some modes of operation that alert the vehicle user of sudden changes in tire pressure. Such alert modes fall under FCC 15.231(a)(4), and may operate during the pendency of the alarm condition. A detailed list of all operating modes is included in the Description of Operation exhibit included in this application.

### 3 Emissions

#### 3.1 General Test Procedures

## 3.1.1 Radiated Test Setup and Procedures

Radiated electromagnetic emissions from the EUT are first evaluated in our shielded fully anechoic chamber. Spectrum and modulation characteristics of all emissions are recorded, and emissions above 1 GHz are fully characterized. The anechoic chamber contains a set-up similar to that of our outdoor 3-meter site, with a turntable and antenna mast. Instrumentation, including spectrum analyzers and other test equipment as detailed in Section 1.2 are employed. After indoor pre-scans, emission measurements up to 1 GHz are made on our outdoor 3-meter Open Area Test Site (OATS). If the EUT connects to auxiliary equipment and is table or floor standing, the configurations prescribed in ANSI C63.4 / CISPR 22 are followed. Alternatively, a layout closest to normal use (as declared by the provider) is employed if the resulting emissions appear to be worst-case in such a configuration. See Figure 3.

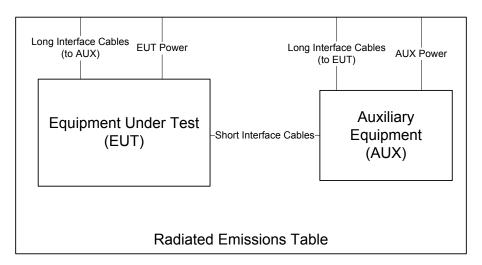

Figure 3: Radiated Emissions Diagram of the EUT.

All intentionally radiating elements are placed on the test table lying flat, on their side, and on their end (3-axes) and the resulting worst case emissions are recorded. For both horizontal and vertical polarizations, the test antenna is raised and lowered from 1 to 4 m in height until a maximum emission level is detected. The EUT is then rotated through 360° in azimuth until the highest emission is detected. The test antenna is then raised and lowered one last time from 1 to 4 m and the worst case value is recorded.

If the EUT exhibits spurious emissions due to internal receiver circuitry, such emissions are measured with an appropriate carrier signal applied. For devices with intentional emissions below 30 MHz, a shielded loop antenna is used as the test antenna. It is placed at a 1 meter receive height and appropriate low frequency magnetic field extrapolation to the regulatory limit distance is employed. Emissions between 30 MHz and 1 GHz are measured using tuned dipoles and/or calibrated broadband antennas. Emissions above 1 GHz are characterized using standard gain horn antennas. Care is taken to ensure that test receiver resolution and video bandwidths meet the regulatory requirements, and that the emission bandwidth of the EUT is not reduced.

When the regulatory limit is specified as a field strength at at a given distance, the dBm values measured on the test receiver / analyzer are converted to  $dB\mu V/m$  at three meters, using

$$E_{3m} = 107 + P_R + K_A - K_G + K_E - C_F$$

where  $P_R$  is the power recorded on spectrum analyzer, in dBm,  $K_A$  is the test antenna factor in dB/m,  $K_G$  is the pre-amplifier gain and cable loss in dB,  $K_E$  is duty correction factor (where applicable) in dB, and  $C_F$  is a distance conversion (employed only if limits are specified at alternate distance) in dB. This value is then compared with the regulatory limit extrapolated to the same distance. When presenting data at each frequency, the highest measured emission under all possible EUT orientations (3-axes) is reported. Photographs of the test setup employed are depicted in Figure 4.

Figure 4: Radiated Emissions Test Setup Photograph(s).

## 3.1.2 Conducted Test Setup and Procedures

**Battery Power Conducted Spurious** The EUT is not subject to power line conducted emissions measurements when it is powered solely by its internal battery.

## 3.1.3 Power Supply Variation

Tests at extreme supply voltages are made if required by the procedures specified in the test standard, and results of this testing are detailed in this report.

**DC Extreme Voltages** If the EUT is designed for operation from a lead-acid battery power source, the extreme test voltages are evaluated between 90% and 130% of the nominal battery voltage declared by the manufacturer. For float charge applications using gel-cell type batteries, extreme test voltages are evaluated between 85% and 115% of the nominal battery voltage declared. For all battery operated equipment, worst case intentional and spurious emissions are re-checked employing a new (fully charged) battery.

#### 3.1.4 Thermal Variation

Tests at extreme temperatures are made if required by the procedures specified in the test standard, and results of this testing are detailed in this report. The provider has declared that the EUT is designed for operation over the temperature range  $-40^{\circ}$  C to  $+85^{\circ}$  C. Before any temperature measurements are made, the equipment is allowed to reach a thermal balance in the test chamber, temperature and humidity are recorded, and thermal balance is verified via a thermocouple based probe.

#### 3.2 Intentional Emissions

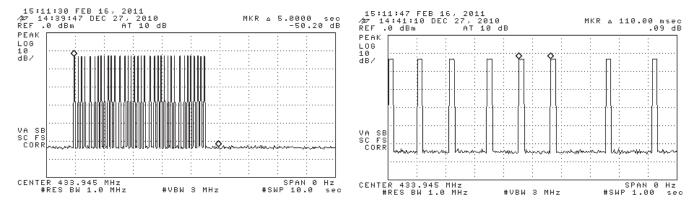

# 3.2.1 Fundamental Emission Pulsed Operation

The details and results of testing the EUT for pulsed operation are summarized in Table 3. Plots showing the measurements made to obtain these values are provided in Figure 5.

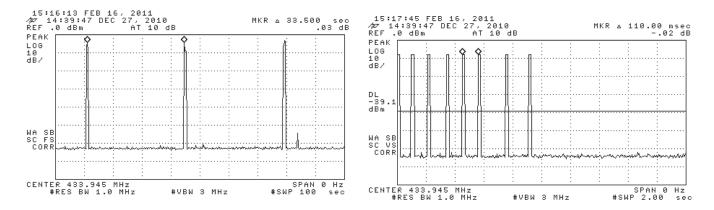

Table 3: Pulsed Emission Characteristics (Duty Cycle).

#### 3.2.2 Fundamental Emission Bandwidth

Emission bandwidth (EBW) of the EUT is measured with the device placed in the test mode(s) with the shortest available frame length and minimum frame spacing. Radiated emissions are recorded following the test procedures listed in Section 1.1. The 20 dB EBW is measured as the max-held peak-detected signal when the IF bandwidth is greater than or equal to 1% of the receiver span. For complex modulations other than ASK and FSK, the 99% emission bandwidth per IC test procedures has a different result, and is also separately reported. The results of EBW testing are summarized in Table 4. Plots showing measurements employed to obtain the emission bandwidth reported are provided in Figure 6.

Table 4: Intentional Emission Bandwidth.

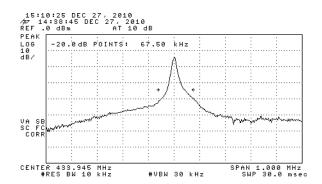

Figure 6: Intentional Emission Bandwidth.

#### 3.2.3 Fundamental Emission

Following the test procedures listed in Section 1.1, radiated emissions measurements are made on the EUT for both Horizontal and Vertical polarized fields. Table 5 details the results of these measurements.

Table 5: Fundamental Radiated Emissions.
