

CLASS II PERMISSIVE CHANGE / REASSESSMENT

The original OTR TPM Sensor has been replaced by a sensor with an improved mechanical enclosure (plastic chassis). The antenna tang length (length of feed point wire) has changed from 8 mm to 15 mm to accommodate this new, larger housing. This change requires an associated minor change of a passive component value in the RF section (R10/C07 is changed from a 10 pF capacitor to a 180 Ohm resistor). The battery employed in the device has also been upgraded to a high temp version of the same family.
