FCC TEST REPORT

For
47 CFR Part 24E

FCC ID:	**MSQV66S**
Equipment:	V66S Multimedia Mobile Phone (GSM850/PCS Dual Band)
Tx Frequency:	1850.2 MHz ~ 1909.8 MHz
Report No:	05-0602-E
Test date:	10.17-10.21.2005
Applicant:	ASUSTeK Computer Inc. (華碩電腦股份有限公司)
Address:	No.150, Li-Te Rd., Peitou, Taipei, Taiwan, R.O.C.
Model No:	V66S

The tests listed in this report have been done to demonstrate compliance with the applicable requirements in FCC rules Part 24 and IC standard RSS-133.

CONTENTS

1. LABORATORYINFORMATION

Test laboratory	A Test Lab Techno. Corp. EMC Testing Lab. Tel: 886-(0)2-82122828 Fax：886-(0)2-82122828
Lab Location:	No. 99,An-Chung Rd, Hsin-Tien City, Taipei Hsien, Taiwan R.O.C.

2. CUSTOMER INFORMATION

Client:	**ASUSTeK Computer Inc.**
Contact person:	**Mf Chen**
Receipt of EUT:	**09.23.2005**
Date of testing:	**10.17-10.21.2005**
Date of report:	**11.08.2005**

Contents approved:

Eddie Chen **2005/11/08**

3. SUMMARY OF TEST RESULTS

The EUT has been tested according to the following specifications:

APPLIED STANDARD: FCC 47 CFR Part 24 & Part 2 / IC RSS-133			
Standard Section	**Test Type and Limit**	**Result**	**REMARK**
2.1047(d)	Modulation Characteristics	PASS	NA
2.1046, 24.232	Maximum Peak Output Power Limit: max.2 watts e.i.r.p peak power	PASS	Meet the requirement of limit Minimum passing margin is 4.19 (33-28.81) dBm at 1909.80MHz
2.1055, 24.235	Frequency Stability AFC Freq. Error vs. Voltage AFC Freq. Error vs. Temperature Limit: max. ±0.1ppm	PASS	Meet the requirement of limit
2.1049, 24.238(b)	Occupied Bandwidth	PASS	Meet the requirement of limit
24.238(b)	Band Edge Measurements	PASS	NA
2.1051, 24.238	Conducted Spurious Emissions	PASS	Meet the requirement of limit Minimum passing margin is –17.80dB at 1692.861MHz
2.1053, 24.238	Radiated Spurious Emissions	PASS	Meet the requirement of limit Minimum passing margin is –17.20dB at 3820MHz

4. EUT INFORMATION

1. The EUT was tested with the following adapter

BRAND:	**ASUSTeK Computer Inc.**
MODEL:	**V66S**
INPUT:	100-240Vac,50-60Hz
UOTPUT:	5.2Vdc, 430mA

2.IMEI Code: 010714000000194

3. The hardware version: R1.03

4. The software version: V2.0.0.D

5. The above EUT information was declared by manufacturer and for more detailed features description please refers to the manufacturer's specifications or User's Manual.

4.1 EUT description

Product	Dual-band Mobile Phone
Model NO.	V66S
POWER SUPPLY	3.7Vdc from Battery 5.2Vdc from AC Adapter
MODULATION TYPE	GMSK
FREQUENCY RANGE	Tx Frequency： 1850.2MHz~1909.8MHz(PCS band) Rx Frequency： 1930.2MHz~1989.8MHz (PCS band)
Conducted output power (EUT RF output connector)	Channel Power(dBm) 512 29.25 661 29.25 810 29.25
NUMBER OF CHANNEL	299
MAX. RADITED EIRP PEAK OUTPUT POWER	28.81dBm(0.76watts)
ANTENNA TYPE	Internal Antenna
DATA CABLE	NA
I/O PORTS	NA
ASSOCIATED DEVICES	Earphone plus Microphone
EUT Extreme Vol. Range	3.55Vdc to 4.2Vdc

4.2 EUT TEST SETUPS

For each test the EUT was exercised to find out the worst case of operation modes and device configuration.

5. APPLICABLE STANDARDS

The EUT is a Dual-band Mobile Phone. According to the specifications of the manufacturer, it must comply with the requirements of the following standards:

FCC 47 CFR Part 2

FCC 47 CFR Part 24

IC RSS-133

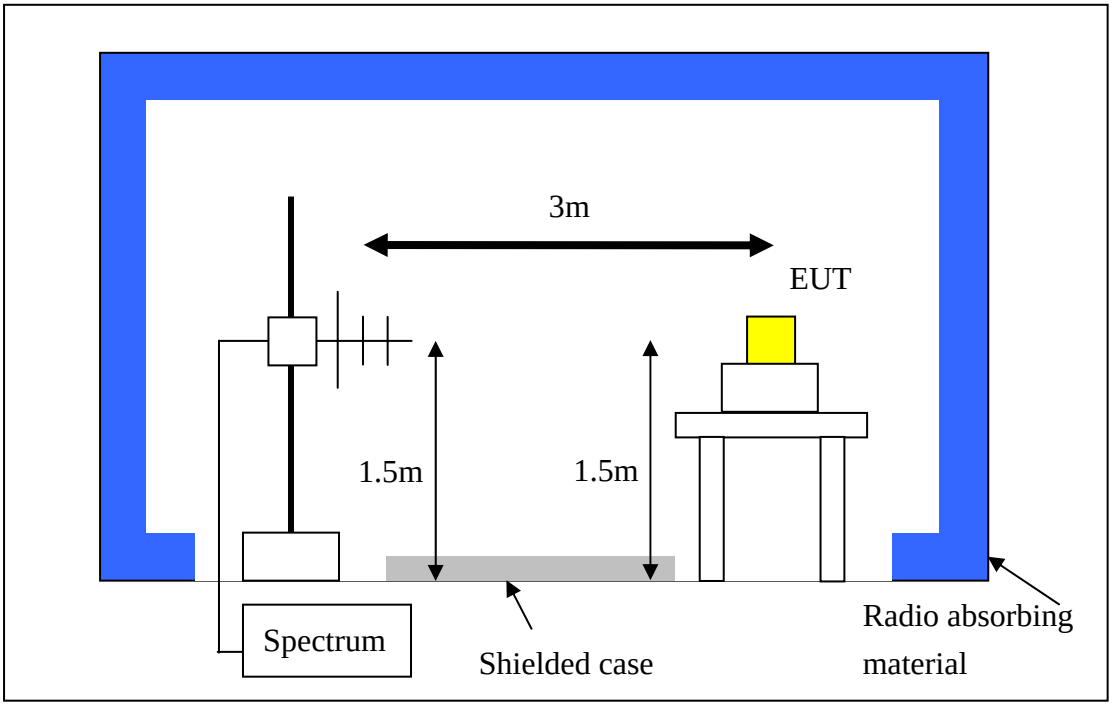
EIA/TIA 603

All test items have been performed and recorded as per the above standards.

6. RADIATED RF OUTPUT POWER

6.1 Test setup

The EUT was set on a non-conductive turn table in a semi anechoic chamber. In the corner of the chamber there was a communication antenna, which was connected to the BS simulator located outside the chamber. The radiated power from the EUT was measured with an antenna fixed to a antenna tower. The tower and turn table were remotely controlled to turn the EUT and change the antenna polarization. The measured signal was routed from the measuring antenna to the spectrum analyzer. The BS simulator was used to set the TX channel and power level and modulate the TX signal with different bit patterns.



For the actual test configuration, please refer to the related item – Photographs of the Test Configuration.

6.2 Test method

a. The EUT was set up for the maximum peak power with GPRS link data modulation. The power was measured with Advantest Spectrum Analyzer. All measurements were done at 3 channels, 512, 661 and 810(low, middle and high operational frequency range.)

b. In the semi-anechoic chamber, E.I.R.P peak power measurement. EUT placed on the 1.5m height of Turn Table, rotated the table around 360 degrees to search the maximum radiation power and receiver antenna shall be rotated vertical and horizontal polarization to find the maximum polar radiated power. The “Read Value” is the maximum power value recorded on the spectrum analyzer.

c. The substitution horn antenna is substituted for EUT at the same position and signal generator export the CW signal to the calibration antenna. The signal generator level has to adjust to have the same emission nature. The radiated power can be calculated via the factor and antenna.

d. Actually the real E.I.R.P peak power is equal to “SG Power Value + Correction Factor (dB), Correction Factor (dB) =Substitution Antenna Gain (dBi) - Cable Loss(dB) ”

6.3 EUT operation modes

a. A transmission link is established between the EUT and the test simulator.

b. The EUT is set to transmit at a maximum output power on the specific channel frequency selected.

6.4 Limit

The radiated EIRP shall meet the limits of the specific rule Part.

For 24.232(b) “Mobile / Portable station are limited to 2 watts e.i.r.p” and

For 24.232(c) “Peak transmit power must be measure over any interval of continuous transmission using instrumentation calibration in terms of rms-equivalent voltage.”

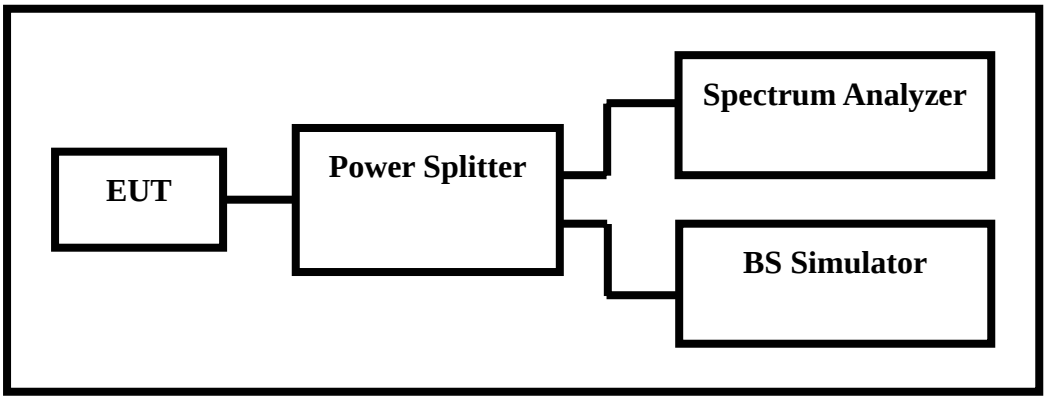
7. CONDUCTED SPURIOUS EMISSION

7.1 Test setup

A set of LP/HP/BS filters was used to prevent overloading the spectrum analyzer. The BS simulator was used to set the TX channel with GPRS and power level and modulate the TX signal with different bit patterns. The test was done using an automated test system, where the measurement devices were controlled by a computer.



7.2 Test method

a) The emissions were searched and maximized measuring antenna and manipulating the EUT.

b) All suspicious frequencies with emission levels were recorded.

7.3 EUT operation modes

a. A transmission link is established between the EUT and the test simulator.

b. The EUT is set to transmit at a maximum output power on the specific channel frequency selected.

7.4 Limit

In the FCC 24.238(a), On any frequency outside a licensee's frequency block within USPCS spectrum, the power of any emission shall be attenuated below the transmitter power (P) by at least 43 +10 log (P) dB. In the FCC 24.238(c), When measuring the emission limits, the nominal carrier frequency shall be adjusted as close to the licensee's frequency block edges (low channel 512 and high channel 810), both upper and lower edges are compliance with FCC 24.238(b), Adjacent to the frequency block a resolution bandwidth of at least one percent of the emission bandwidth of the fundamental emission of the transmitter may be employed.

8 RADIATED SPURIOUS EMISSION

8.1 Test setup

A set of LP/HP/BS filters was used to prevent overloading the spectrum analyzer. The BS simulator was used to set the TX channel with GPRS and power level and modulate the TX signal with different bit patterns. The test was done using an automated test system, where the measurement devices were controlled by a computer.

8.2 Test method

a) The emissions were searched and maximized by rotate the turn table and raise and lower the antenna and manipulating the EUT. EUT placed on the 1.5m height of Turn Table, rotated the table around 360 degrees to search the maximum radiation power and receiver antenna shall be rotated vertical and horizontal polarization to find the maximum polar radiated power. The “Read Value” is the maximum power value recorded on the spectrum analyzer.

b) All suspicious frequencies with emission levels were recorded.

c) The EUT was replaced with a substituting antenna.

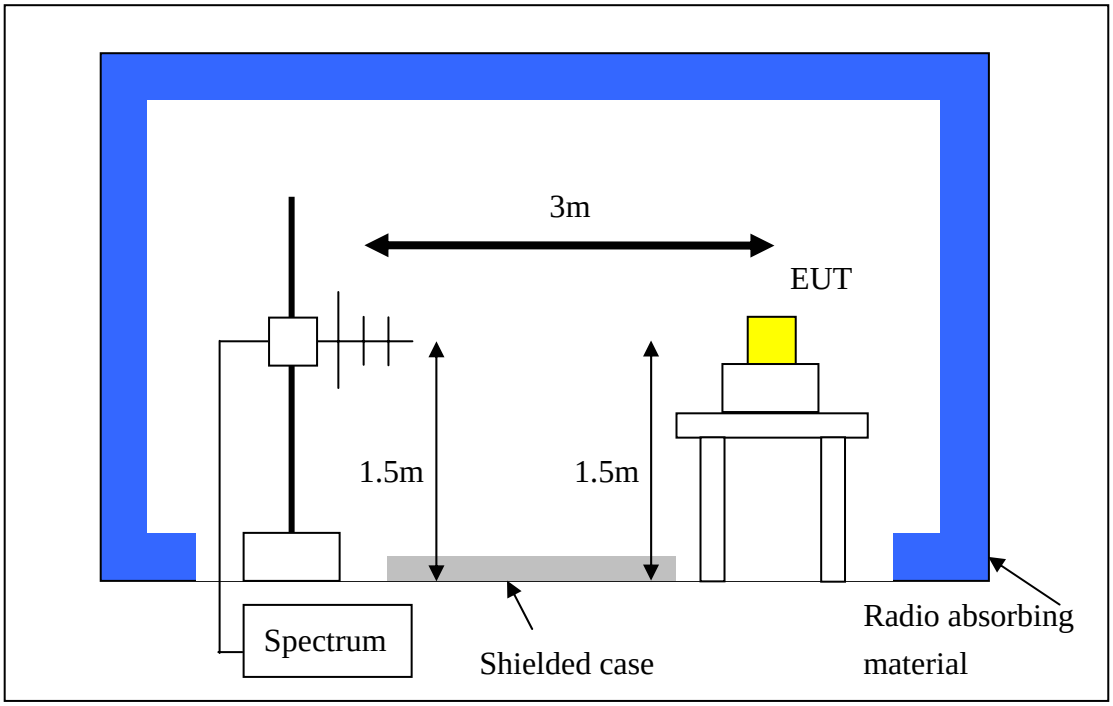
The substitution horn antenna is substituted for EUT at the same position and signal generator export the CW signal to the calibration antenna. The signal generator level has to adjust to have the same emission nature. The radiated power can be calculated via the factor and antenna.

d) For each frequency recorded, the substituting antenna was fed with the power (from signal generator) giving the same reading as in (b). These power levels were reported. Actually the real E.I.R.P peak power is equal to “SG Power Value + Correction Factor (dB), Correction Factor (dB) =Substitution Antenna Gain (dBi) - Cable Loss(dB) ”

8.3 EUT operation modes

a. The EUT makes a phone call to the GSM simulator.

b. The GSM simulator station system controlled a EUT to export maximum output power under transmission mode and specific channel frequency.



8.4 Limit

In the FCC 24.238(a), On any frequency outside a licensee's frequency block within USPCS spectrum, the power of any emission shall be attenuated below the transmitter power (P) by at least 43 +10 log (P) dB. In the FCC 24.238(c), When measuring the emission limits, the nominal carrier frequency shall be adjusted as close to the licensee's frequency block edges (low channel 512 and high channel 810), both upper and lower edges are compliance with FCC 24.238(b), Adjacent to the frequency block a resolution bandwidth of at least one percent of the emission bandwidth of the fundamental emission of the transmitter may be employed.

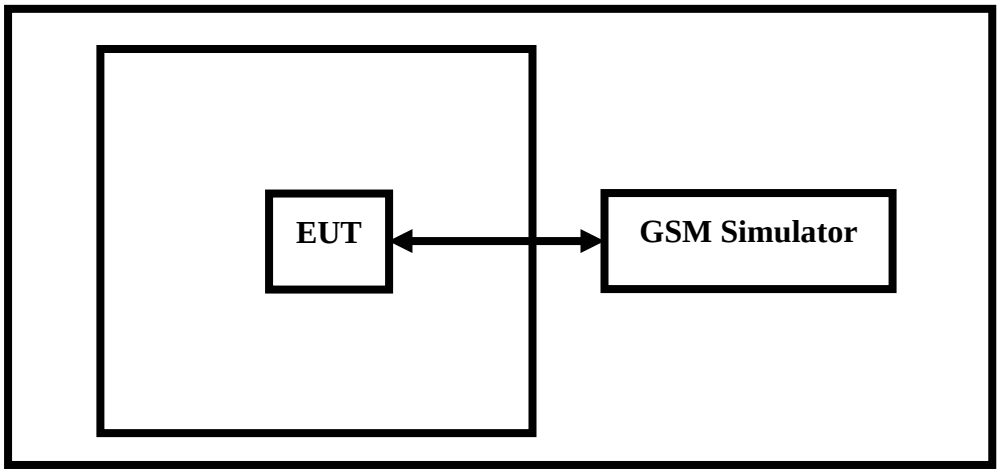
9. FREQUENCY STABILITY, TEMPERATURE VARIATION

9.1 EUT operation modes

EUT	Dual-band Mobile Phone	**MODEL**	V66S
MODE	TX channel 661	**POWER CONTROL LEVEL**	0
INPUT POWER (SYSTEM)	120Vac, 60 Hz	**DETECTOR FUNCTION**	500 Bursts
ENVIRONMENTAL CONDITIONS	25 deg. C, 50 % RH, 999 hPa	**TESTED BY:** Sam Chaung	

9.2 Test setup

The BS simulator was used to set the TX channel with GPRS and power level and modulate the TX signal with different bit patterns.



9.3 Test method

a) The climate chamber temperature was set to the minimum value and the temperature was allowed to stabilize. A soak time (after chamber reaches appropriate temperature) is 60 minutes.

b) The EUT was placed in the chamber

c) The EUT was set in idle mode for 45 minutes.

d) The EUT was set to transmit.

e) The transmit frequency error was measured immediately

9.4 Limit

According to the FCC part 2.4235 shall be tested the frequency stability. The rule is defined that" The frequency stability shall be sufficient to ensure that the fundamental emission stays within the authorized frequency block." The frequency error rate is according to the JTC standard that the frequency error rate shall be accurate to within 0.1 ppm of the received frequency from the base station. The extreme temperature rule is comply with the 2.1055(a)(1) –30℃~50℃.

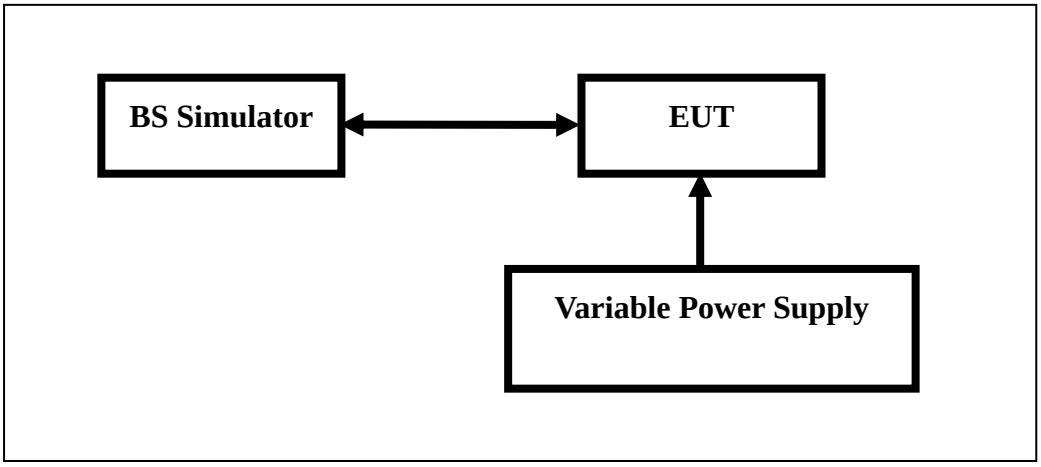
10.1 EUT operation modes

EUT	Dual-band Mobile Phone	**MODEL**	V66S
MODE	TX channel 661	**POWER CONTROL LEVEL**	0
INPUT POWER (SYSTEM)	120Vac, 60 Hz	**DETECTOR FUNCTION**	500 Bursts
ENVIRONMENTAL CONDITIONS	25 deg. C, 50 % RH, 999 hPa	**TESTED BY**:	Sam Chaung

10.2 Test setup

The BS simulator was used to set the TX channel with GPRS and power level and modulate the TX signal with different bit patterns.



10.3 Test method

The EUT battery was replaced with an adjustable power supply. The frequency stability was measured at nominal voltage and at the battery cut-off point.

10.4 Limit

According to the FCC part 2.4235 shall be tested the frequency stability. The rule is defined that" The frequency stability shall be sufficient to ensure that the fundamental emission stays within the authorized frequency block." The frequency error rate is according to the JTC standard that the frequency error rate shall be accurate to within 0.1 ppm of the received frequency from the base station. The test extreme voltage is according to the 2.1055(d)(1) Vary primary supply voltage from 85 to 115 percent of the nominal value for other than hand carried battery equipment.

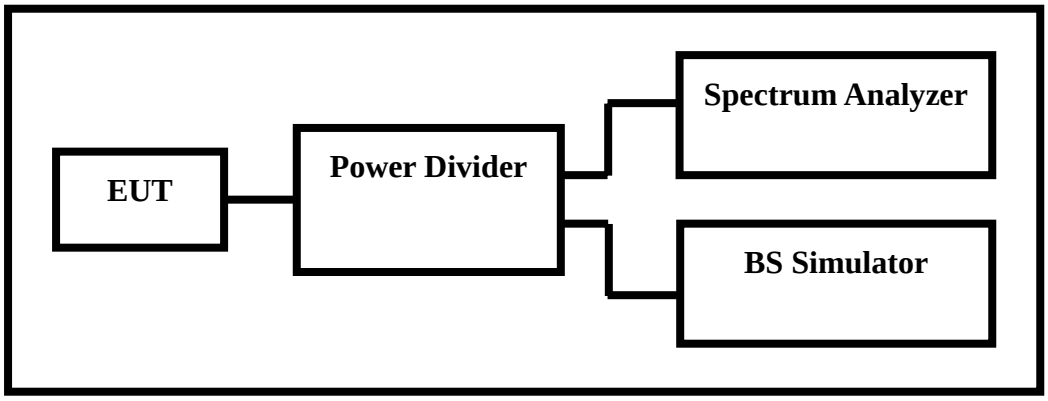
10.5 Results

Frequency deviation, voltage variation			
Level	**Voltage [V]**	**Deviation [Hz]**	**Deviation [ppm]**
Battery full point	4.2	28	0.015
Nominal	3.8	27	0.014
Battery cut-off point	3.55	24	0.013

11. 99% OCCUPIED BANDWIDTH

11.1 Test setup

The BS simulator was used to set the TX channel with GPRS and power level and modulate the TX signal with different bit patterns.



11.2 EUT operation modes

a. The EUT makes a phone call to the GSM with GPRS simulator.

b. The GSM with GPRS simulator station system controlled a EUT to export maximum and minimum output power under transmission mode and specific channel frequency.

11.3 Limit

According to FCC 24.238(b) specified that emission bandwidth is defined as the width of the signal between two points, one below the carrier center frequency and one above the carrier center frequency, outside of which all emissions are attenuated at least 26 dB below the transmitter power.

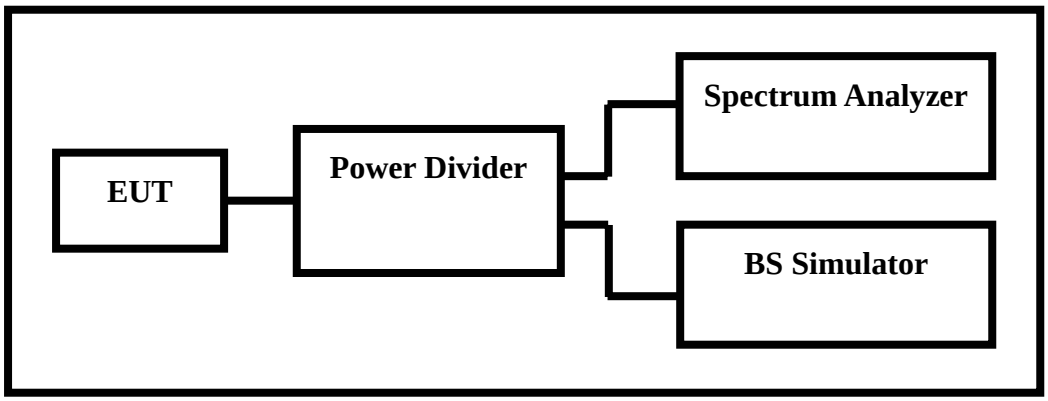
：

12. BANDEDGE COMPLIANCE

12.1 Test setup

The BS simulator was used to set the TX channel with GPRS and power level and modulate the TX signal with different bit patterns.



The band edge measurement used the power splitter via EUT RF power connector between simulation base station and spectrum analyzer.

12.2 EUT operation modes

a. The EUT makes a phone call to the GSM with GPRS simulator.

b. The GSM with GPRS simulator station system controlled a EUT to export maximum output power under transmission mode and specific channel frequency

12.3 Limit

The PCS frequency bands refer to the FCC 24.229 rule. According to FCC 24.238(b) specified that emission bandwidth is defined as the width of the signal between two points, one below the carrier center frequency and one above the carrier center frequency, outside of which all emissions are attenuated at least 26 dB below the transmitter power. In the 1 MHz bands immediately outside and adjacent to the frequency block a resolution bandwidth of at least one percent of the emission bandwidth of the fundamental emission of the transmitter may be employed. Then we measure that the bandwidth is about 300kHz and the resolution bandwidth is 3kHz.
