Measurement of MPE

1. Foreword

In adopt with the Human Exposure IEEE C95.1, and according to the FCC 1.1310. The *Maximum Permissible Exposure (MPE)* is obligated to measure in order to prove the safety of radiation harmfulness to the human body.

The *Gain* of the antenna used is measured in an *Anechoic chamber.* The *maximum total power to the antenna* is to be recorded. By adopting the **Friis Transmission Formula** and the *power gain of the antenna,* we can find the distance right away from the product, where the limit of the MPE is.

2. Description of EUT

EUT	:	ASUS SpaceLink Wireless LAN CompactFlash Card
Classification	:	Portable Device
		(i) Under normal condition, the product maybe used in mobile applications. The antenna is at least 2.5cm away from the user;
		(ii) Caution statement for keeping 2.5cm separation distance and the prohibition of operating next to the person has been printed in the user's manual
Model No.	:	WL110
Granted FCC ID	:	MSQWLCFCWL110
Frequency Range	:	2.412 GHz ~ 2.462GHz
Antenna Kit	:	1 Integral patch antenna
Supported Channel:		11 Channel
Modulation Skill	:	DBPSK, DQPSK, CCK
Power Type	:	Powered by the CompactFlash slot of the client's device

TRC® _Since1985_

3. Limits for _Maximum Permissible Exposure (MPE)_

Frequency Range (MHz)	Electric Field Strength (V/m)	Magnetic Filed Strength (H) (A/m)	Power Density (S) (mW/cm2)	Averaging Time $\|E\|^2$, $\|H\|^2$ or S (minutes)
(A) Limits for Occupational/Controlled Exposure				
0.3-3.0	614	1.63	100	6
3.0-30	1842/f	4.89/f	$900/f^2$	6
30-300	61.4	0.163	1.0	6
300-1500	--	--	f/300	6
1500-100,000	--	--	5	6
(B) Limits for General Population/Uncontrolled Exposure				
0.3-1.34	614	1.63	100	30
1.34-30	824/f	2.19/f	$180/f^2$	30
30-300	27.5	0.073	0.2	30
300-1500	--	--	f/1500	30
1500-100,000	--	--	1.0	30

[The EUT is tested in transmit and receive modes and in the first, middle and the last channel separately. The following shows only our observation have the greatest emissions.]

According to **OET BULLETIN 56 Fourth Edition/August 1999**, **Equation for Predicting RF Fields:**

**Friis Transmission Formula:** $S = \dfrac{PG}{4\pi R^2} = \dfrac{34.12 \times 1.413}{4\pi(2.5)^2} = 9.591 \times 10^{-3}\, mW/cm^2$

Where: S = _power density_ (in appropriate units, e.g. mW/cm2)

P = _power input_ to the antenna (in appropriate units, e.g., mW)

G = _power gain_ of the antenna in the direction of interest relative to an isotropic radiator

R = _distance_ to the center of radiation of the antenna (appropriate units, e.g., cm)

The _Numeric gain G_ of antenna with a gain specified in dB is determined by:

G = Log $^{-1}$ (dB antenna gain/10)

G = Log $^{-1}$ (1.5 / 10) = 1.413
