ILAC / A2LA

Compliance Testing, LLC, has been accredited in accordance with the recognized International Standard ISO/IEC 17025:2005. This accreditation demonstrates technical competence for a defined scope and the operation of a laboratory quality management system (refer to the joint ISO-ILAC-IAF Communiqué dated January 2009).

The tests results contained within this test report all fall within our scope of accreditation, unless noted below.

Please refer to http://www.compliancetesting.com/labscope.html for current scope of accreditation.

Testing Certificate Number: 2152.01

FCC Site Reg. #349717

IC Site Reg. #2044A-2

The applicant has been cautioned as to the following

15.21 - Information to User

The user's manual or instruction manual for an intentional radiator shall caution the user that changes or modifications not expressly approved by the party responsible for compliance could void the user's authority to operate the equipment.

15.27(a) - Special Accessories

Equipment marked to a consumer must be capable of complying with the necessary regulations in the configuration in which the equipment is marketed. Where special accessories, such as shielded cables and/or special connectors are required to enable an unintentional or intentional radiator to comply with the emission limits in this part, the equipment must be marketed with, i.e. shipped and sold with, those special accessories. However, in lieu of shipping or packaging the special accessories with the unintentional or intentional radiator, the responsible party may employ other methods of ensuring that the special accessories are provided to the consumer without an additional charge.

Information detailing any alternative method used to supply the special accessories for a grant of equipment authorization or retained in the verification records, as appropriate. The party responsible for the equipment, as detailed in § 2.909 of this chapter, shall ensure that these special accessories are provided with the equipment. The instruction manual for such devices shall include appropriate instructions on the first page of text concerned with the installation of the device that these special accessories must be used with the device. It is the responsibility of the user to use the needed special accessories supplied with the equipment.

Standard Test Conditions Engineering Practices

Except as noted herein, the following conditions and procedures were observed during the testing:

In accordance with ANSI C63.10-2013 and unless otherwise indicated in the specific measurement results, the ambient temperature of the actual EUT was maintained within the range of 10° to 40°C (50° to 104°F) unless the particular equipment requirements specified testing over a different temperature range. Also, unless otherwise indicated, the humidity levels were in the range of 10% to 90% relative humidity.

Measurement results, unless otherwise noted, are worst-case measurements.

EUT Description

Model: TAG-006 Description: Body Worn Location Device Firmware: N/A Software: N/A Serial Number: N/A Antenna Gain: -1.6 dBi Additional Information: The EUT implements GFSK.

EUT Operation during Tests

The EUT was set to transmit at 100% duty cycle on the low, middle and highest channel of operation at the maximum available power level.

Accessories: None

Cables: None

Modifications: None

15.203: Antenna Requirement:

Х	The antenna is permanently attached to the EUT
	The antenna uses a unique coupling
	The EUT must be professionally installed
	The antenna requirement does not apply

Output Power Engineer: Kenneth Lee Test Date: 6/19/2018

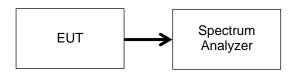

Test Procedure

The EUT was connected directly to a spectrum analyzer. The Spectrum Analyzer was set to the following:

 $RBW \ge DTS$ Bandwidth $VBW \ge 3 \times RBW$ Span $\ge 3 \times RBW$ Sweep time = auto couple Detector = peak Trace Mode = max hold

The EUT was set to transmit on the lowest, middle and highest frequencies at the maximum power level. The RF output power was measured using the spectrum analyzer's marker peak function

Test Setup

Transmitter Output Power

Tuned Frequency (MHz)	Measured Value (dBm)	Specification Limit	Result
2402	3.327	1 W (30 dBm)	Pass
2426	3.549	1 W (30 dBm)	Pass
2480	2.433	1 W (30 dBm)	Pass

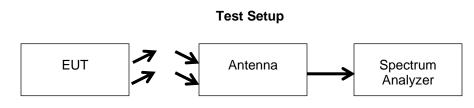

Radiated Spurious Emissions Engineer: Kenneth Lee Test Date: 6/19/2018

Test Procedure Radiated Spurious Emissions: 30 – 1000 MHz

The EUT was setup in a semi-anechoic test chamber set 3m from the receiving antenna. The EUT was set to transmit on the lowest, middle and highest frequency of operation at the maximum power level. The EUT was tested, in 3 orthogonal axis, by rotating it 360° with the receive antenna in both the vertical and horizontal orientation while raised from 1 to 4 meters to ensure the TX signal levels were maximized. A spectrum analyzer was used to verify that the EUT met the requirements for Radiated Spurious Emissions.

All emissions from 30 MHz to 1 GHz were examined. Measured Level includes antenna and receiver cable correction factors. Correction factors were input into the spectrum analyzer before recording "Measured Level".

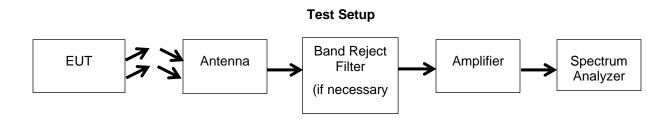

RBW = 100 KHz VBW = 300 KHz Detector – Quasi Peak

Test Procedure for Radiated Spurious Emissions above 1 GHz

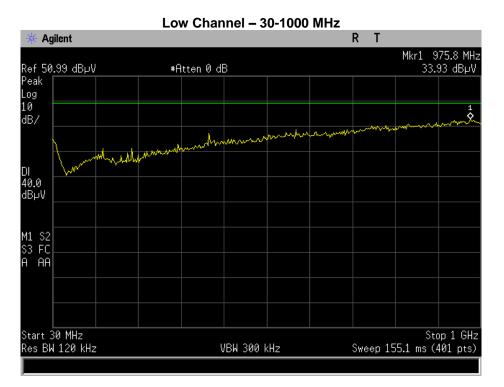

The EUT was setup in a semi-anechoic test chamber set 3m from the receiving antenna. The EUT was set to transmit on the lowest, middle and highest frequency of operation at the maximum power level. The EUT was tested, in 3 orthogonal axis, by rotating it 360° with the receive antenna in both the vertical and horizontal orientation while raised from 1 to 4 meters to ensure the TX signal levels were maximized. A spectrum analyzer was used to verify that the EUT met the requirements for Radiated Spurious Emissions.

RBW = 1 MHz VBW = 3 MHz Detector – Peak

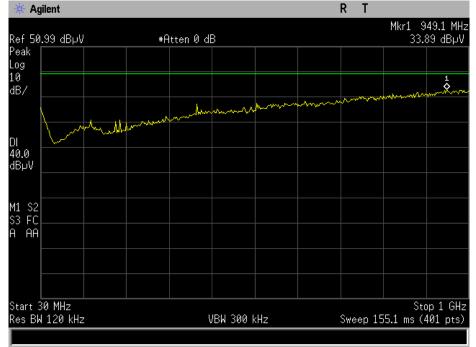

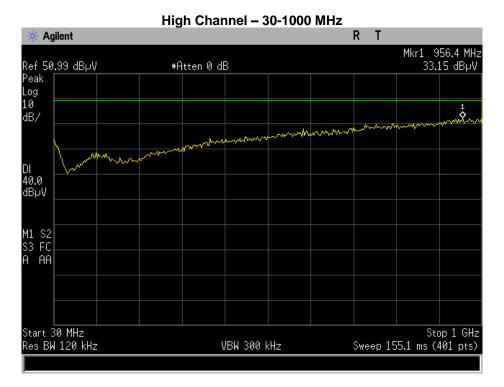

Radiated Spurious Emissions Plots

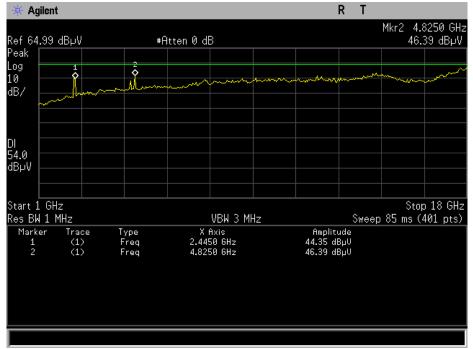

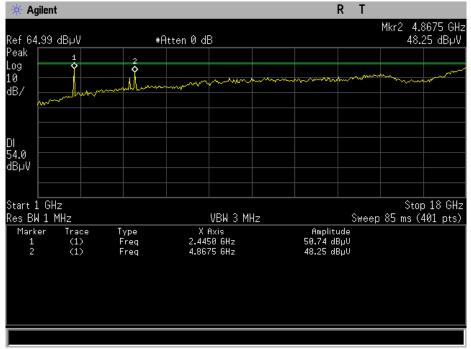

Low Channel – 1-18 GHz

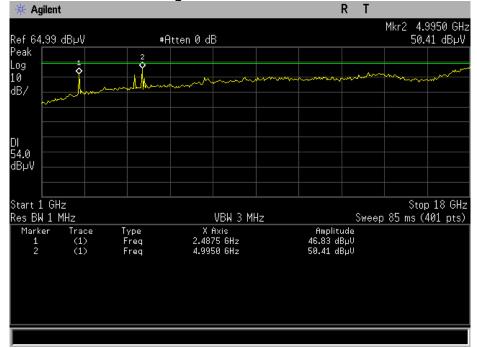

Mid Channel – 1-18 GHz

High Channel – 1-18 GHz

Testing was performed to the 10th harmonic of the device, only noise floor was discovered above 18 GHz.

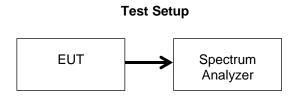

Conducted Spurious Emissions Engineer: Kenneth Lee Test Date: 6/19/2018

Test Procedure

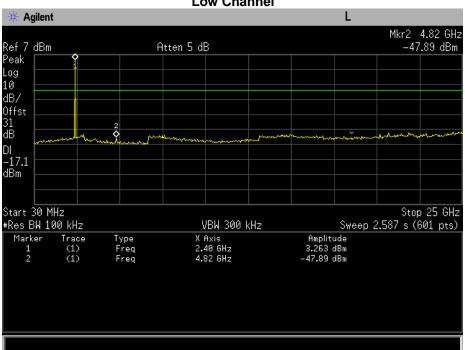

The EUT was connected directly to a spectrum analyzer. The Spectrum Analyzer was set to the following:

 $\begin{array}{l} \mathsf{RBW} = 100 \; \mathsf{kHz} \\ \mathsf{VBW} \geq 3 \; x \; \mathsf{RBW} \\ \mathsf{Peak} \; \mathsf{Detector} \\ \mathsf{Trace} \; \mathsf{mode} = \mathsf{max} \; \mathsf{hold} \\ \mathsf{Sweep} = \mathsf{auto} \; \mathsf{couple} \\ \mathsf{Frequency} \; \mathsf{Range} = 30\mathsf{MHz} - 10^{\mathsf{th}} \; \mathsf{Harmonic} \; \mathsf{of} \; \mathsf{the} \; \mathsf{fundamental} \end{array}$

The EUT was set to transmit on the lowest, middle and highest frequencies at the maximum power level. The trace was allowed to stabilize. All emissions were investigated to insure they were attenuated from the peak fundamental by at least 20dB. If the average power levels were measured then the out-of-band emissions needed to be attenuated by 30dB. In addition, emissions were investigated at the band edges to insure all out-of-band emissions were attenuated 20 or 30dB as necessary.

Emissions at Band Edges Engineer: Kenneth Lee Test Date: 6/19/2018

Test Procedure

The EUT was connected directly to a spectrum analyzer. The spectrum analyzer was used to verify that the EUT met the requirements for band edges.

Test Setup

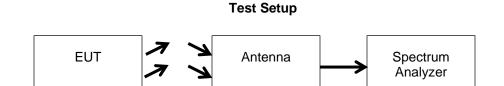

Band Edge Emissions Summary

Tuned Frequency (MHz)	Emission Frequency (MHz)	Monitored Level	Detector	Limit	Result
2402	2400	-52.49	Peak	-20 dBc	Pass
2480	2483.5	-48.27	Peak	-20 dBc	Pass

Restricted Band Edge Test Procedure

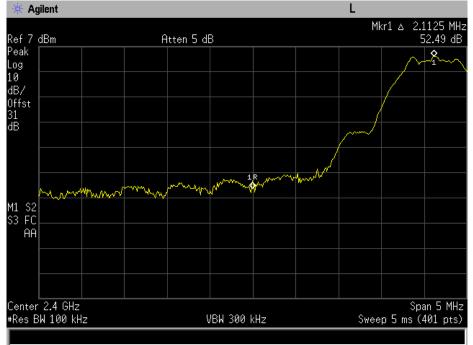

The EUT was tested in a semi-anechoic test chamber set 3m from the receiving antenna. A spectrum analyzer was used to verify that the EUT met the requirements for Restricted Band Edges. The EUT was tested in 3 orthogonal axis by rotating it 360° with the antenna in both the vertical and horizontal orientation and was raised from 1 to 4 meters to ensure the TX signal levels were maximized.

DTS Bandwidth Engineer: Kenneth Lee Test Date: 6/19/2018

Test Procedure

The EUT was connected directly to a spectrum analyzer. The Spectrum Analyzer was set to the following:

RBW = 100 kHz $VBW \ge 3 \text{ x } RBW$ Peak Detector Trace mode = max hold Sweep = auto couple Span = 1.5 x EBW

The EUT was set to transmit at the lowest, middle and highest channels of the band at the maximum power levels. The maximum width of the emission that was determined by the frequencies associated with the two outermost amplitude points (upper and lower frequencies) that were attenuated by 6db and this value was used to determine the width of the carrier. Alternatively, the spectrum analyzer's automatic bandwidth capability was used.

6 dB Occupied Bandwidth Summary

Frequency (MHz)	Measured Bandwidth Specification Limit (kHz) (kHz)		Result
2402	731.947	≥ 500	Pass
2426	716.654	≥ 500	Pass

Transmitter Power Spectral Density (PSD) Engineer: Kenneth Lee Test Date: 6/19/2018

Test Procedure

The EUT was connected directly to a spectrum analyzer. The Spectrum Analyzer was set to the following:

DTS channel center frequency Span 1.5 x DTS bandwidth RBW =3 kHz \leq RBW \leq 100 kHz VBW \geq 3 x RBW Peak Detector Sweep time = auto couple Trace mode = max hold

The EUT was set to transmit at the lowest, middle and highest channels of the band at the maximum power levels. Once the trace has stabilized the peak marker was used to determine the peak power spectral density.

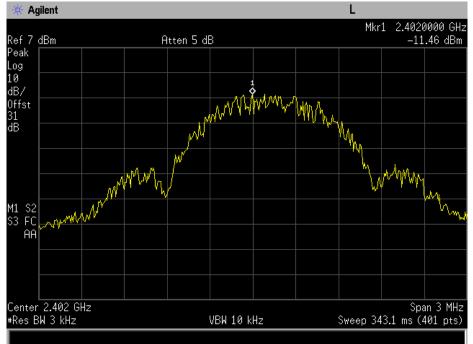

PSD Summary

Frequency (MHz)	Measured Data (dBm)	Specification Limit (dBm)	Result
