## MPE CALCULATION

The MPE calculation for Telular (EIRP = 32 dBm ) @ 20cm:

$$
\begin{aligned}
& \text { P=E } \mathbf{E}^{2} / 120 * \mathrm{pi} \\
& =\{32 \text { (field strength @1meter) +20log(1/0.2) (distance correction factor for } 0.2 \\
& \text { meter) }\}^{2} / \mathbf{1 2 0}^{*} \text { pi } \\
& =\{\mathbf{3 2}(\mathbf{d B m})+\mathbf{1 4} \mathbf{d B}(\text { distance correction factor for } 0.2 \text { meter })\}^{2} / 120 * \mathbf{p i} \\
& =\{46(\mathrm{dBm})\}^{2} / 120 * \mathrm{pi} \\
& =\{45(\mathrm{~V} / \mathrm{m})\}^{2} / 120 * \mathrm{pi} \\
& =(45 \times 45) / 376.6 \\
& =5.38 \mathrm{~W} / \mathrm{m}^{2}
\end{aligned}
$$

* $P$ is power density in $\mathrm{W} / \mathrm{m}^{2}$ and E is field strength in $\mathrm{V} / \mathrm{m}$ *The power density $P=5.38 \mathrm{~W} / \mathrm{m}^{2}$ is less than $10 \mathrm{~W} / \mathrm{m}^{2}$ (listed MPE limit)
