2.4 Calibration

Equipment requiring calibration is calibrated periodically by the manufacturer or according to manufacturer's specifications. Additionally all equipment is verified for proper performance on a regular basis using in house standards or comparisons.

2.5 Measurement Uncertainty

Uncertainty for conducted emissions measurements is $\pm 2.51\text{dB}$.

Uncertainty for radiated emissions measurements is $\pm 4.9\text{dB}$ (30MHz-1GHz), $\pm 4.84\text{dB}$ (>1GHz).

The reported expanded uncertainty is based on a standard uncertainty multiply by a coverage factor $k=2$, providing a level of confidence of approximately 95%.

Table 11: Dwell Time

channel	Frequency (GHz)	Dwell time of one signal Burst (ms)	Total Dwell Time (ms)	Limit (ms)
Low	2402.000	2.97	$(2.97 \times \mathbf{106.81}) = 317.225$	400
Mid	2441.000	2.97	$(2.97 \times \mathbf{106.81}) = 317.225$	400
High	2480.000	2.97	$(2.97 \times \mathbf{106.81}) = 317.225$	400

Note:

Period of the EUT= 0.4 (seconds) x 79 (channels) = 31.6 seconds

For Bluetooth system, there are 1600 timeslots in one second. Supposed the EUT work in DH5 mode operates on a 5-slot transmission and 1-slot receiving basis which may result a maximum dwell time. Thus there are $1600 / (5+1) = 266.7$ transmission per second. In one period for each particular channel there are $(266.7/79) \times 31.6 = 106.81$ times of transmission.

Dwell Time in one period(ms) = Dwell time of one transmission(ms) multiplexes **106.81**
