Report approved by:

Valdis V. Liepa
Research Scientist

Summary

Tests for compliance with FCC Regulations, Part 15.247, and with Industry Canada Regulations, RSS-210, Section 6.2.2 (o), were performed on Hyperlink spread spectrum RF Extended Range LAN System. The DUT is subject to the Rules and Regulations as a transmitter, a receiver, and a digital device. This link uses an FCC certified spread spectrum Proxim radio, but adds high gain antennas, amplifiers, filters, and cables. Here we report on measurements as required for combinations of antennas and amplifiers. We also report on measurements of conducted emissions for a two power supplies used by the power amplifiers.

In testing completed on February 27, 2004, worst case radiated emissions in the restricted bands were met by 0.5 dB at a frequency of 2390 MHz (see p. 13). Power supply conducted emissions, Class B, were met by 1.0 dB at a frequency of 19.50 MHz (see p. 13).

1. Introduction

Hyperlink/Proxim extended range radio configurations were tested for compliance with FCC Regulations, Part 15, adopted under Docket 87-389, April 18, 1989, and with Industry Canada RSS-210, Issue 5, November, 2001. The tests were performed at the University of Michigan Radiation Laboratory Willow Run Test Range following the procedures described in ANSI C63.4-1992 "Methods of Measurement of Radio-Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the Range of 9 kHz to 40 GHz". The Site description and attenuation characteristics of the Open Site facility are on file with FCC Laboratory, Columbia, Maryland (FCC Reg. No: 91050) and with Industry Canada, Ottawa, ON (File Ref. No: IC 2057).

2. Test Procedure and Equipment Used

The test equipment commonly used in our facility is listed in Table 2.1 below. The HP 8593E spectrum analyzer is used for primary amplitude and frequency reference.

Table 2.1 Test Equipment

Test Instrument	Eqpt. Used	Manufacturer/Model
Spectrum Analyzer (0.1-1500 MHz)		Hewlett-Packard, 182T/8558B

3. Configuration and Identification of Device Under Test

The DUT is a spread spectrum RF wireless link operating in 2400 - 2483.5 MHz band. The system tested consists of a laptop computer, PCMCIA radio, coax cable, (choice of) amplifier, (choice of) band-pass filter, and (choice of) antenna. There are three primary configurations for this system: 1) outdoor amplifier and separate antenna with DC injector coaxial power feed, 2) indoor amplifier (model number includes a "I") with DC power (fed directly into the amplifier) and separate antenna, 3) no amplifier with antenna connected directly to the Proxim radio. The system has been designed to operate with up to 12 channels from 2412 to 2462 MHz.; however, depending on the choice of components used (amplifier, filter, antenna), channels are restricted so as to meet the FCC and IC emissions limits (See the *Acceptable Configurations* exhibit).

The DUT was designed and manufactured by Hyperlink Technologies Inc, 1200 Clint Moore Road, Suite 14, Boca Raton, Florida 33487. Figure 3.1 shows the block diagram of the basic system. It is identified as:

Hyperlink Technologies, Inc.
Amplifier Model(s): HA2401GI-XXX, HA2401G-XXX
FCC ID: MYF-G11FNFPC
IC: 2837A-G11FNFPC

XXX stands for the amplifier power rating in milliwatts.

26 configurations were fully tested for compliance. It is demonstrated in this test report that the tested configurations accurately depict the worst case emissions from the DUT out of all configurations listed in the *Acceptable Configurations* exhibit, which is included in this filing. It is the intent of this test report to demonstrate compliance for all configurations listed in the *Acceptable Configurations* exhibit.

Note: All amplifier models consist of the same PCB, with an input attenuator/AGC circuit that IS TUNED ONLY BY THE MANUFACTURER FOR DIFFERENT OUTPUT POWER LEVELS. Since the amplifier models herein have an amplification stage biased independent from the input power level, the spectral integrity of the device is consistent across all models in this test report.

Note: The AMPLIFIERS USED IN THIS FILING WILL ONLY BE SOLD AS A COMPLETE SYSTEM as shown within this application (PCMCIA Card + DC Injector (if outdoor) + Amplifier + Filter + Antenna).

3.1 EMI Relevant Modifications

During the course of testing, amplifier (if included), filter (if included), and antenna were selected and then the available channels for the particular configuration were reduced (if necessary) to meet the band-edge and harmonic emission limits.

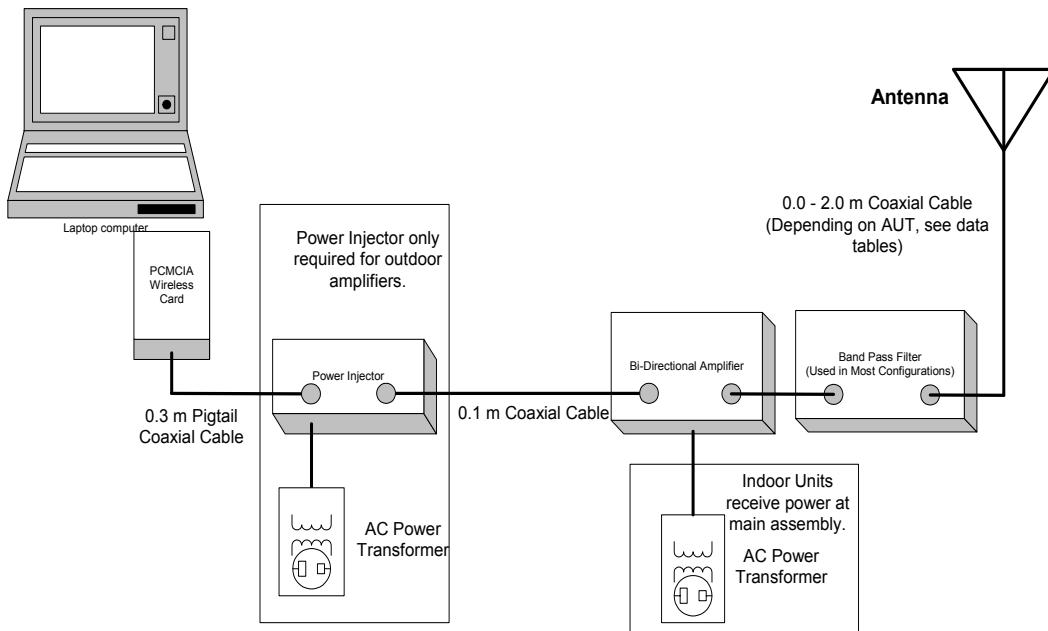

Figure 3.1 Basic block diagram of the system

4. Emission Limits

4.1 Radiated Emission Limits

Since the DUT is a spread spectrum device (15.247, 2.4 GHz), the radiated emissions are subject to emissions in restricted bands (15.205). The applicable frequencies, through ten harmonics, are given below in Table 4.1. Emission limits from digital circuitry are specified in Table 4.2.

Table 4.1 Radiated Emission Limits (FCC:15.205; IC:RSS-210, 6.3) - Transmitter

Frequency (MHz)	Fundamental Ave. Elim (3m)		Spurious* Ave. Elim (3m)	
	(μ V/m)	dB (μ V/m)	(μ V/m)	dB (μ V/m)
2400-2483.5	---		---	
2310-2390	Restricted Bands		500	54.0
2483.5-2500				
4500-5250				
7250-7750	Restricted Bands		500	54.0
14470-14500				
17700-21400				
22010-23120				
23600-24000				

* Measure up to tenth harmonic; 1 MHz res. BW, 100 Hz video BW (for average detection)

Table 4.2 Radiated Emission Limits (FCC:15.109;IC: RSS-210, 7.3) - Digital device.

Frequency (MHz)	Class A ds = 10 m		Class B ds = 3 m	
	(μ V/m)	dB (μ V/m)	(μ V/m)	dB (μ V/m)
30-88	90	39.0	100	40.0
88-216	150	43.5	150	43.5
219-960	210	46.4	200	46.0
960-	300	49.5	500	54.0

120 kHz BW up to 1 GHz, 1 MHz BW above 1 GHz

4.2 Conductive Emission Limits

Table 4.3 Conducted Emission Limits (FCC/CISPR:15.107; IC: RSS-210, 6.6).

Frequency MHz	Class A (dB μ V)		Class B (dB μ V)	
	Quasi-peak	Average	Quasi-peak	Average
.150 - 0.50	79	66	66 - 56*	56 - 46*
0.50 - 5	73	60	56	46
5 - 30	73	60	60	50

Notes:

1. The lower limit shall apply at the transition frequency
2. The limit decreases linearly with the logarithm of the frequency in the range 0.15-0.50 MHz:

*Class B Quasi-peak: dB μ V = 50.25 - 19.12*log(f)

*Class B Average: dB μ V = 40.25 - 19.12*log(f)

3. 9 kHz RBW

5. Radiated Emission Tests and Results

Note: The following measurements for a given amplifier/radio configuration are performed with attenuation added between the radio and the amplifier to simulate decreased input power to the amplifier due to cable loss. Since these are AGC amplifiers, their compliance must be demonstrated over a range of input power levels (See Figure 5.0). IT WAS DETERMINED THAT, OVER THE FULL RANGE OF POWER SETTINGS, 6 DB OF ATTENUATION (EQUIVALENT TO 100 FT OF CABLE) PLACED AT THE INPUT OF THE AMPLIFIERS GIVES THE HIGHEST RADIATED EMISSIONS IN THE RESTRICTED BANDS. BECAUSE OF THE LARGE OUTPUT FILTER USED IN ALL AMPLIFIED CONFIGURATIONS, FUNDAMENTAL BAND-EDGE EMISSIONS ARE NOT THE LIMITING FACTOR IN SELECTING COMPLIANT CONFIGURATIONS. THUS, THIS LEVEL OF INPUT ATTENUATION WAS USED THROUGHOUT TESTING, UNLESS OTHERWISE STATED.

5.1 Anechoic Chamber Measurements

In our chamber, there is a set-up similar to that of an outdoor 3-meter site, with a turntable, an antenna mast, and a ground plane. Instrumentation includes spectrum analyzers and other equipment as needed. For these tests the receiver antennas were mounted on the antenna mast at about 1.2 m height, and the DUT on a turntable with foam blocks at 3 meter distance. Standard gain horn antennas were used for the measurements. At 2.4 GHz the horns were connected directly to a spectrum analyzer via RG-214 coaxial cable, and above 2.4 GHz a pre-amp was added. The cables and the pre-amplifier used were specially calibrated for these tests using a spectrum analyzer with built in sweep generator.

The DUT antenna was rotated in all possible ways and the maximum emission recorded. Photographs in the *Test Setup Photos* exhibit demonstrate the measurement set-up.

Note: Digital Radiated emissions limits were > 20 dB below the FCC Class B limit. No data is reported.

5.2 Outdoor Measurements

None made

5.3 Computations and Results

To convert the dBm measured on the spectrum analyzer to dB(μ V/m), we use expression

$$E_3(\text{dB}\mu\text{V}/\text{m}) = 107 + P_R + K_A - K_G + K_E$$

where P_R = power recorded on spectrum analyzer, dB, measured at 3m

K_A = antenna factor, dB/m

K_G = pre-amplifier gain, including cable loss, dB

K_E = pulse operation correction factor, dB

When presenting the data, the dominant measured emissions at each frequency, under all of the possible orientations, are given. A listing of systems tested for emissions compliance is given in Table 5.0. Computations and results are given in Tables 5.1 through 5.26. There we see that in the worst case the DUT meets the limit by 0.5 dB at 2390 MHz in Table 5.26. Note, that besides the emission measurements, each table contains the frequency range of operation (in upper left section of the table). Please also note that these tables simply indicate that the configurations listed meet the restricted band limits set forth by the FCC and IC, and do not alone demonstrate compliance to all FCC/IC radiated emissions guidelines. Specifically, these configurations are still subject to FCC Part 15.247(b)(4)(i). A complete listing of FCC/IC compliant configurations is listed in the *Acceptable Configurations* exhibit.

5.4 Duty Factor for Normal Operation

No Duty Factor was used during testing of this device, as it was programmed to transmit continuous.

6. Other Measurements and Computations

Note: The following measurements for a given amplifier/radio configuration are performed with attenuation added between the radio and the amplifier to simulate decreased input power to the amplifier due to cable loss. Since these are AGC amplifiers, their compliance must be demonstrated over a range of input power levels (See Figure 5.0). IT WAS DETERMINED THAT, OVER THE FULL RANGE OF POWER SETTINGS, 6 DB OF ATTENUATION (EQUIVALENT TO 100 FT OF CABLE) PLACED AT THE INPUT OF THE AMPLIFIERS GIVES THE HIGHEST RADIATED EMISSIONS IN THE RESTRICTED BANDS. BECAUSE OF THE LARGE OUTPUT FILTER USED IN ALL AMPLIFIED CONFIGURATIONS, FUNDAMENTAL BAND-EDGE EMISSIONS ARE NOT THE LIMITING FACTOR IN SELECTING COMPLIANT CONFIGURATIONS. THUS, THIS LEVEL OF INPUT ATTENUATION WAS USED THROUGHOUT TESTING, UNLESS OTHERWISE STATED.

6.1 Peak-to-Average Ratio (15.35(b))

For the measurements presented here (for emissions in restricted bands), the DUT was programmed to transmit continuous, and such was verified with spectrum analyzer set to zero-span mode. See Figure 6.1. The average measurements were made using 1 MHz RBW and 100 Hz VBW. The peak measurements were made using 1 MHz RBW and 3 MHz VBW.

Typically the difference between peak and average was 12 to 13 dB, and never exceeded the 20 dB limit.

6.2 Potential Health Hazard EM Radiation Level

Please see the RF Exposure exhibit for a detailed listing of the potential health hazard radiation levels and appropriate safe operating distances for the configurations in this test report.

6.3 Peak Output Power (15.247(b))

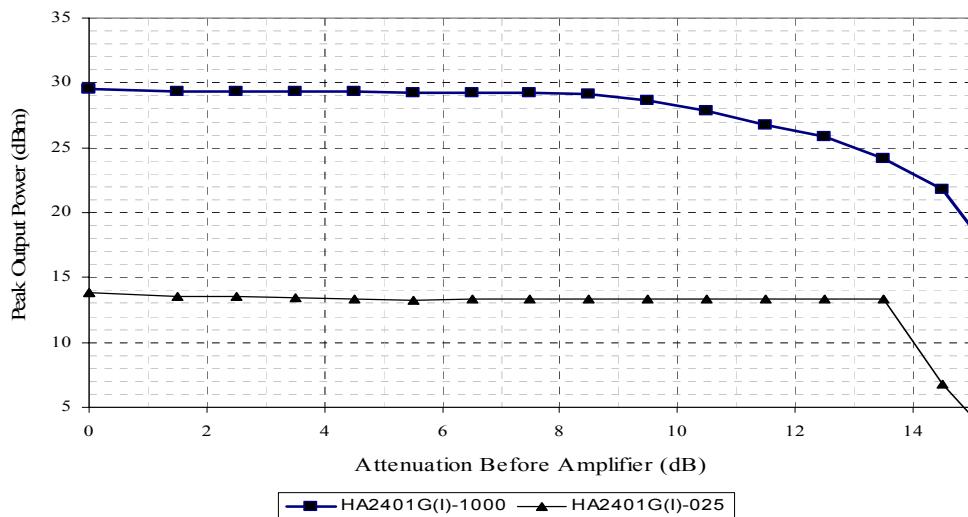

For this measurement, the DUT was set in a test mode for continuous data transmission. A direct comparison measurement was made between a known CW source and the radio/amplifier/filter setup using calibrated attenuators, an HP 8472A Crystal Detector (with HP 54510A, 250 MHz digitizing oscilloscope) and an HP 432A average power meter. The known CW source power was first verified using the HP 432A and correlated with the DC output voltage from the HP 8472A Crystal Detector. Next, the radio/amplifier/filter peak output power was recorded from the HP 8472A Crystal Detector's output waveform for both the 802.11b and 802.11g modes at the channels indicated below. The maximum input rise/fall time of the 802.11b/g waveforms was measured to be 60 ns, which is sufficiently greater than the calibrated 25 ns rise/fall time of the HP 8472A Crystal Detector when properly loaded with the 50 Ω input of the HP 54510A oscilloscope.

Since the DUT transmits in continuous mode, there is no adjustment needed to the readings. Table 6.2, below, presents the results. The peak output power limit is 30dBm.

Table 6.2 Peak and Average Output Power (Antenna Conducted)

Freq (MHz)	Peak Power to Antenna (dBm)		Comment
	IEEE 802.11b	IEEE 802.11g	
2427	27.4	28.9	HA2401G(I), 30 dBm with Output Filter
2437	28.4	29.2	
2447	27.7	28.9	
2427	13.2	13.3	HA2401G(I), 14 dBm with Output Filter
2437	13.1	13.5	
2447	13.2	13.3	
2412	13.5	17.1	Radio Alone
2437	13.7	17.5	
2462	13.9	17.4	

Figure 5.0 Peak Amplifier Output Power vs. Cable Attenuation

6.4 Power Line Conducted Emissions (15.270)

The RF amplifier is powered from a switching power supply (ASCM-26). Conducted emissions were measured using a LISN in the standard set-up. Photographs of the set-up are in the *Setup Photos* exhibits.

Certification for the PCMCIA radio demonstrates that the FCC Class B line conducted emissions limits are met by the PCMCIA card and an associated computer. Since the manufacturer of the system we are testing is not responsible for the sale or distribution of the computer used with the PCMCIA card, measurement of conducted emission from the particular computer used during testing has little relevance. In addition, since the amplifiers used in these configurations contain no internal oscillators or low frequency sources, it is unlikely that these added components could corrupt the AC conducted emissions demonstrated in the PCMCIA card filing. Essentially, the computer used in our emissions testing is a peripheral device, whose compliance has already been demonstrated in the PCMCIA radio filing and its own Document of Conformity. See the equipment list for PCMCIA card and Laptop FCC/IC identifier information. A copy of the PCMCIA test report has been included as an exhibit.

NOTE: This device has shown compliance with the conducted emissions limits in 15.107, 15.207, or 18.307 adopted under FCC 02-157 (ET Docket 98-80) and may be marketed after July 11, 2005 and is not affected by the 15.37(j) or 18.123 transition provisions.

6.5 Bandwidth (15.247(a)(2))

For this test, the DUT was put in a test mode for continuous data transmission, and the amplifier was attached, including 6 dB of attenuation, to the radio. The spectrum analyzer was connected where the antenna attaches to the system. The analyzer was set for RBW=100 kHz, VBW=300 kHz, SPAN=30 MHz. The 6-dB bandwidth was measured for the lowest, middle, and highest channels that could be used in a given configuration. Since the amplifier itself is identical, despite changes in the configured output power levels, results for only the highest and lowest power settings are reported here. It was verified that these reported emissions are consistent across all power settings. Because of the excessive number of plots taken to ascertain this data, only an example subset is shown in Figures 6.9-6.10. The complete readings obtained are:

30 dBm, (HA2401G(I)-1000 Amplifier)

<u>Frequency</u>	<u>802.11b 6 dB Bandwidth</u>	<u>802.11g 6 dB Bandwidth</u>
2.427 GHz	11.55 MHz	14.63 MHz
2.437 GHz	12.15 MHz	16.50 MHz
2.447 GHz	11.25 MHz	15.83 MHz

14 dBm, (HA2401G(I)-025 Amplifier)

<u>Frequency</u>	<u>802.11b 6 dB Bandwidth</u>	<u>802.11g 6 dB Bandwidth</u>
2.427 GHz	11.03 MHz	13.43 MHz
2.437 GHz	12.00 MHz	16.58 MHz
2.447 GHz	11.10 MHz	13.43 MHz

Radio Alone

<u>Frequency</u>	<u>802.11b 6 dB Bandwidth</u>	<u>802.11g 6 dB Bandwidth</u>
2.412 GHz	10.13 MHz	16.58 MHz
2.437 GHz	12.60 MHz	16.35 MHz
2.462 GHz	12.60 MHz	16.50 MHz

6.6 Peak Output Power Reduction (15.247(b)(4)(i))

For any configuration with a total EIRP greater than 36 dBm, the FCC/ IC rules state that the peak output power of the device must be decreased by 1 dB for every 3 dB that the EIRP is greater than 36 dBm. In this test report, this rule part is applied once all other rule parts are demonstrated compliant. See the *Peak Output Power Reduction* exhibit for tables relating the decrease in peak output power for the configurations deemed compliant in the *Acceptable Configurations* exhibit.

6.7 RF Antenna Conducted Spurious Emissions (15.247(c))

For this test, the DUT was put in a test mode for continuous data transmission, and the amplifier was attached, including 6 dB of attenuation, to the radio. The spectrum analyzer was connected where the antenna attaches to the system. The analyzer was set for RBW=100 kHz, VBW=300 kHz, the frequency was swept from 0 to 25 GHz. See Figures 6.2 through 6.5 and 6.18 through 6.19. In the plots, only the fundamental is seen, the rest is noise. In all cases, the noise is at least 25 dB below the carrier. (Limit -20.0 dB below carrier). Included in Figures 6.6 through 6.10 and 6.20 are plots demonstrating band-edge compliance at lower and upper edges of the operating band.

6.8 Power Spectral Density and Line Spacing (15.247(d))

For this test, the DUT was put in a test mode for continuous data transmission, and the amplifier was attached, including 6 dB of attenuation, to the radio. The spectrum analyzer was connected where the antenna attaches to the system. The spectrum was first scanned for the maximum spectrum peaks and then at these peaks the sweep was repeated with RBW=3 kHz, VBW=300 kHz, SPAN=300 kHz, and RBW=1 kHz, VBW=300 kHz, SPAN=100 kHz. Because of the excessive number of plots taken to ascertain this data, only one example set is shown in Figures 6.12-6.17. The complete readings obtained are:

Operating Mode: 802.11b

30 dBm, (HA2401G(I)-1000 Amplifier)

<u>Frequency</u>	<u>Analyzer Reading</u>	<u>Line Spacing</u>
2.42845 GHz	1.84 dBm (Limit 8.0 dBm)	4.3 kHz

<u>Frequency</u>	<u>Analyzer Reading</u>	<u>Line Spacing</u>
2.42947 GHz	-17.33 dBm (Limit 8.0 dBm)	4.8 kHz
2.43824 GHz	-16.47 dBm (Limit 8.0 dBm)	4.8 kHz
2.44574 GHz	-17.90 dBm (Limit 8.0 dBm)	4.0 kHz

Radio Alone

<u>Frequency</u>	<u>Analyzer Reading</u>	<u>Line Spacing</u>
2.41685 GHz	-13.20 dBm (Limit 8.0 dBm)	4.3 kHz
2.43947 GHz	-11.51 dBm (Limit 8.0 dBm)	4.5 kHz
2.46447 GHz	-11.91 dBm (Limit 8.0 dBm)	4.3 kHz

Table 5.0

For Amplifier(s): HA2401GI-XXX, HA2401G-XXX, where XXX stands for the amplifier power rating labeled in mW (see below)

Table of Configurations Tested to Demonstrate Compliance with FCC/IC Radiated Emissions Limits 802.11b & 802.11g. (not notwithstanding FCC Part 15.247(b)(4))

NOTE: This table does not necessarily indicate compliant configurations, as FCC 15.247(b)(4)(i) has not yet been considered. Please see the Approved Configurations exhibit for a complete listing of FCC/IC compliant configurations and the channels in which they may operate.

† Complies with FCC / IC radiated emissions limits (Filter Required)

+ Complies with FCC / IC radiated emissions limits (Filter Required)
x Tested to demonstrate compliance with FCC/IC radiated emissions limits (Filter Required); Corresponding Data Table available in the Test Report

Complies with FCC / IC radiated emissions limits (NO Filter Required)

X Tested to demonstrate compliance with FCC/IC radiated emissions limits (NO Filter Required); Corresponding Data Table available in the Test Report.

*Average limit

Meas. 12/12/2003; U of Mich.

Since $V_{peak} \geq V_{qp} \geq V_{ave}$ and if $V_{testpeak} < V_{avelim}$, then V_{qplim} and V_{avelim} are met.
