Subject: RE: Permissive change question

Question:

Background: A radio was originally granted with a 2 watt power level. Power was limited to 1 watt with the use of software tool available to the installer. The current version of the software will not allow a power setting of higher than 1 watt. The Edge modulation is being added to the radio, which normally would be covered as a Class II permissive change. Given that the power is now limited to 1 watt, can a permissive change still be used?

Answer:

A Permissive change can be added for the Edge modulation at the lower power.
