

### **The description of Wireless product:**

The transmitter gathers all needed Video by Image sensor and Audio signals by Microphone, then amplifier them and the amplifier signals are under simulate-digital conversion by chip VC0702NJSJ, changed to digital signal, the Video Amplifier FS8170 will strengthen the signal, and The carry frequency to be modulated by audio & video has been power amplified by Q2 filtered through the band pass filter (C20, C18, C23 )which the higher harmonica of signal reduced to lower level. The purer signal is emitted by antenna (RFOUT).
