## 2. Test setups

### Setup 5 (Conducted measurements)

The test was performed inside a shielded room. A BT simulator was not used.

### Setups 1 - 4 (Radiated measurements)

The test was performed inside a semi anechoic shielded room. For the duration of the test the EUT was placed on a non-conductive support 0.8 m high standing on the turntable. The tower and turn table were remotely controlled to turn the EUT and change the antenna polarization. The measured signal was routed from the measuring antenna to the spectrum analyzer. A BT simulator was not used.

### 3. Standards and measurement methods

The test were performed in guidance of the CFR 47, FCC Rules Part 15 Subpart C, ANSI C63.4 (2003), CISPR 22 Ed. 6.0, Public notice DA 00-705, ANSI C63.10 (2009), IC standards RSS-GEN (Issue 3, December 2010) and RSS-210 (Issue 8, December 2010).

3m measurement distance

<i>Frequency range (MHz)</i>	<i>Limit Peak (dBc)</i>
<b>2390 - 2400</b>	<b>≤ -20</b>

The measurement results were obtained as described below.

$$E [\mu V/m] = U_{RX} + A_{CABLE} + AF$$

Where

$U_{RX}$  receiver reading

$A_{CABLE}$  attenuation of the cable

$AF$  antenna factor

Duty Cycle correction factor(dB) -21.60 dB was used.

### 4.3 Spurious radiated emission

The test was performed as a compliance test. The test parameters concerned were as follows:

<i>EUT</i>	<b>setup1, setup2, setup3, setup4</b>
<i>Site name</i>	<b>Nemko Oy / Perkkaa</b>
<i>FCC rule part</i>	<b>§ 15.247 (d), § 15.209</b>
<i>Section in RSS-210</i>	<b>A8.5</b>

<i>Test conditions</i>	<b>22 °C, 31 % RH</b>

#### 4.3.1 EUT operation mode

<i>EUT channel</i>	<b>Channel 0, 7 and 15</b>
--------------------	----------------------------

#### 4.3.2 Test method and limit

The test was performed in a semi-anechoic shielded room. The EUT was placed on a non-conductive 0.8 m high table standing on the turntable. During the test the distance from the EUT to the measuring antenna was 3 m. The excess length of the cables of the EUT were made into bundles 30-40 cm in length (see photograph 1). In order to find the maximum levels of the disturbance radiation the angle of the turntable, the height of the measuring antenna and the lay-out of the EUT cables were varied during the tests. The test was performed with the measuring antenna being both in horizontal and vertical polarizations.

Vertical and horizontal polarizations in the frequency range 30 – 1000 MHz was measured by using the peak detector. During the peak detector scan. the turntable was rotated from 0° to 360° with 30° step with the antenna heights 1.0 m and 3.0 m. The highest levels of the radiated interference field strength measured by using the quasi-peak detector were recorded.

Vertical and horizontal polarizations in the frequency range 1000 – 25000 MHz was measured by using the peak detector. During the peak detector scan. the turntable was rotated from 0° to 360° with 15° step with the antenna heights 1.0 m, 1,5m, 2.0m, 2,5m and 3.0 m. The highest levels of the radiated interference field strength measured by using the average and peak detectors were recorded.

**Minimum Standard:** In any 100kHz bandwidth outside the frequency band in which the transmitter is operating, emissions shall be at least 20 dB below the fundamental emission or shall not exceed the following field strength limits:

Emissions falling in the restricted bands of 15.205 shall not exceed the limits shown in §15.209. At frequencies equal to or less than 1000 MHz, compliance with the limits in §15.209 shall be demonstrated using measurement instrumentation employing a CISPR quasi-peak detector. Above 1000 MHz, compliance with the emission limits in §15.209 shall be demonstrated based on the average value of the measured emissions.

The EUT was tested on three orthogonal axis.

The device was tested from 30 MHz to the tenth harmonic of the highest fundamental frequency per 15.33.

The device was tested on three channels per 15.31(l).

The CFR 47 Part 15. Subpart B. Class B limit of 500 μV/m has been calculated to correspond 54 dB(μV/m) as follows:  $[dB(\mu V/m)] = 20 \log[\mu V/m]$ .

The measurement results were obtained as described below.

$$E [\mu V/m] = U_{RX} + A_{CABLE} + AF - G_{PREAMP}$$

Where

$U_{RX}$  receiver reading

$A_{CABLE}$  attenuation of the cable

$AF$  antenna factor

$G_{PREAMP}$  gain of the preamplifier

Duty Cycle correction factor(dB) -21.60 dB was used.

Spectrum analyzer with zero span was used to investigate spectrum.

15.35(c) Unless otherwise specified, e.g. § 15.255(b), when the radiated emission limits are expressed in terms of the average value of the emission, and pulsed operation is employed, the measurement field strength shall be determined by averaging over one complete pulse train, including blanking intervals, as long as the pulse train does not exceed 0.1 seconds. As an alternative (provided the transmitter operates for longer than 0.1 seconds) or in cases where the pulse train exceeds 0.1 seconds, the measured field strength shall be determined from the average absolute voltage during a 0.1 second interval during which the field strength is at its maximum value. The exact method of calculating the average field strength shall be submitted with any application for certification or shall be retained in the measurement data file for equipment subject to notification or verification.

##### 4.8.1 Test data

*Pulse period (T) = 6.4s/67=95.5ms*

*Pulses/100ms=2*

*Length of one pulse = 4.16ms*

*DutyCycleCorrectionFactor=20\*log(Tocc/100)=20\*log(2\*4.16/100)=-21.60dB*

#### 4.9 AC power line conducted emissions

<i>EUT</i>	<b>setup4</b>
<i>Site name</i>	<b>Nemko / Perkkaa</b>
<i>FCC rule part</i>	<b>§ 15.207</b>
<i>Test method</i>	<b>CISPR 22 /ANSI C63.4-2003</b>
<i>Date of testing</i>	<b>27.12.2013</b>
<i>Test equipment</i>	<b>348, 745, 694</b>
<i>Test conditions</i>	<b>22 °C, 30 % RH</b>

##### 4.9.1 Test method and limit

The measurement is made according to ANSI C63.4-2003. The test was performed inside a shielded room where the floor and one of the walls of the test site comprised the reference ground plane (RGP). For the duration of the test the EUT was placed on a non-conductive table 0.8 m high standing on the reference ground plane (see photograph 2). The excess length of the cables of the EUT were made into bundles 30-40 cm in length. The power input cable of the EUT was connected to an artificial mains network. The test was performed separately on the phase and also on the neutral wire.

The disturbances were first examined by performing a spectrum scan by using a peak detector. The general procedure in the conducted disturbance emission test is that no further measurements are necessary if the disturbance levels measured by using the peak detector are below the limit value defined for the measurement performed by using an average detector.

If not, then at the test frequencies concerned the measurement is performed also by using a quasi-peak detector. If the disturbance levels measured by using the quasi-peak detector are below the limit value defined for the measurement performed by using an average detector, then measurements by using the average detector are not necessary.
