### 7.3. MAXIMUM PERMISSIBLE EXPOSURE

## LIMITS \& RSS-102

§1.1310 The criteria listed in Table 1 shall be used to evaluate the environmental impact of human exposure to radio-frequency (RF) radiation as specified in $\S 1.1307$ (b), except in the case of portable devices which shall be evaluated according to the provisions of $\S 2.1093$ of this chapter.

TABLE 1-LImits for Maximum Permissible Exposure (MPE)

| Frequency range ( MHz ) | Electric field strength (V/m) | Magnetic field strength (A/m) | Power density ( $\mathrm{mW} / \mathrm{cm}^{2}$ ) | Averaging time (minutes) |
| :---: | :---: | :---: | :---: | :---: |
| (A) Limits for Occupational/Controlled Exposures |  |  |  |  |
| 0.3-3.0 | 614 | 1.63 | *(100) | 6 |
| 3.0-30 | 18427 | 4.89才 | ${ }^{*}\left(900 \mathrm{fr}^{2}\right)$ | 6 |
| 30-300 | 61.4 | 0.163 | 1.0 | 6 |
| 300-1500 |  | ...................... | f/300 | 6 |
| 1500-100,000 |  | ................ | 5 | 6 |
| (B) Limits for General Population/Uncontrolled Exposure |  |  |  |  |
| 0.3-1.34 | 614 | 1.63 | ${ }^{*}(100)$ | 30 |
| 1.34-30 | 8247 | 2.197 | ${ }^{*}\left(180 \mathrm{~F}^{2}\right)$ | 30 |

TABLE 1-LIMITS FOR MAXIMUM PERMISSIBLE EXPOSURE (MPE)-Continued

| Frequency range (MHz) | Electric field strength (V/m) | Magnetic field strength (A/m) | Power density ( $\mathrm{mW} / \mathrm{cm}^{2}$ ) | Averaging time (minutes) |
| :---: | :---: | :---: | :---: | :---: |
| 30-300 | 27.5 | 0.073 | 0.2 | 30 |
| 300-1500 | .................... | ....................... | f/1500 | 30 |
| 1500-100,000 |  | ......................... | 1.0 | 30 |

[^0]${ }^{*}=$ Plane-wave equivalent power density
NOTE 1 TO TABLE 1: Occupational/controlled limits apply in situations in which persons are exposed as a consequence of their employment provided those persons are fully aware of the potential for exposure and can exercise control over their exposure. Limits for oocupational/controlled exposure also apply in situations when an individual is transient through a location where occupational/controlled limits apply provided he or she is made aware of the potential for exposure.
NOTE 2 TO TABLE 1: General population/uncontrolled exposures apply in situations in which the general public may be exposed, or in which persons that are exposed as a consequence of their employment may not be fully aware of the potential for exposure or can not exercise control over their exposure.

## CALCULATIONS

Given

$$
\mathrm{E}=\sqrt{ }(30 * \mathrm{P} * \mathrm{G}) / \mathrm{d}
$$

and
$S=E^{\wedge} 2 / 3770$
where
$\mathrm{E}=$ Field Strength in Volts/meter
P = Power in Watts
$\mathrm{G}=$ Numeric antenna gain
$\mathrm{d}=$ Distance in meters
$S=$ Power Density in milliwatts/square centimeter
Combining equations and rearranging the terms to express the distance as a function of the remaining variables yields:

$$
\mathrm{d}=\sqrt{ }((30 * \mathrm{P} * \mathrm{G}) /(3770 * \mathrm{~S}))
$$

Changing to units of Power to mW and Distance to cm , using: P
$(\mathrm{mW})=\mathrm{P}(\mathrm{W}) / 1000$ and
$\mathrm{d}(\mathrm{cm})=100 * \mathrm{~d}(\mathrm{~m})$
yields
$\mathrm{d}=100 * \sqrt{ }((30 *(\mathrm{P} / 1000) * \mathrm{G}) /(3770 * \mathrm{~S}))$
$\mathrm{d}=0.282 * \sqrt{ }(\mathrm{P} * \mathrm{G} / \mathrm{S})$
where
$\mathrm{d}=$ distance in cm
$\mathrm{P}=$ Power in mW
$\mathrm{G}=$ Numeric antenna gain
$S=$ Power Density in $\mathrm{mW} / \mathrm{cm}^{\wedge} 2$
Substituting the logarithmic form of power and gain using: P
$(\mathrm{mW})=10^{\wedge}(\mathrm{P}(\mathrm{dBm}) / 10)$ and
$\mathrm{G}($ numeric $)=10^{\wedge}(\mathrm{G}(\mathrm{dBi}) / 10)$
yields
$\mathrm{d}=0.282 * 10 \wedge((\mathrm{P}+\mathrm{G}) / 20) / \sqrt{ } \mathrm{S}$
Equation (1)
$\mathrm{S}=0.0795 * 10^{\wedge}((\mathrm{P}+\mathrm{G}) / 10) / \mathrm{d}^{\wedge} 2$
Equation (2)
where
$\mathrm{d}=$ MPE distance in cm
$\mathrm{P}=$ Power in dBm
$\mathrm{G}=$ Antenna Gain in dBi
$\mathrm{S}=$ Power Density Limit in $\mathrm{mW} / \mathrm{cm}^{\wedge} 2^{2}$

Equation (1) and the measured peak power is used to calculate the MPE distance. Equation (2) and the measured peak power is used to calculate the Power density.

## LIMITS

From §1.1310 Table 1 (B),
for Public $\mathrm{S}=1.0 \mathrm{~mW} / \mathrm{cm}^{2}$
for Professional, $S=5.0 \mathrm{~mW} / \mathrm{cm}^{2}$

## RESULTS

No non-compliance noted:

For this EUT, $\mathrm{P}=13.52 \mathrm{dBm}$, Max $\mathrm{G}=1.0 \mathrm{dBi}$, and $\mathrm{d}=20 \mathrm{~cm}$

Plug all three items into equation (2), and yields,

| Power Density <br> Limit <br> $\left(\mathbf{m W} / \mathbf{c m}^{2}\right)$ | Output <br> Power <br> $(\mathbf{d B m})$ | Antenna <br> Gain <br> $(\mathbf{d B i})$ | Power <br> Density <br> $\left(\mathbf{m W} / \mathbf{c m}^{2}\right)$ |
| :---: | :---: | :---: | :---: |
| $1.0 / 5.0$ | 13.52 | 1.0 | 0.0056 |

NOTE: For mobile or fixed location transmitters, the minimum separation distance is 20 cm , even if calculations indicate that the MPE distance would be less.

[^0]:    $\mathrm{f}=$ frequency in MHz
