6.0 Field Strength of Spurious Radiation

FCC 2.1053, 22.901(d), 24.238(a)

6.1 Test Procedure

The measurement antenna was placed at a distance of 3 meters from the EUT. During the tests, the antenna height and polarization as well as EUT azimuth were varied in order to identify the maximum level of emissions from the EUT.

The frequency range up to tenth harmonic of each of the three fundamental frequency (low, middle, and high channels) for each band (cellular and PCS) was investigated. The tests were performed with the Radio Card installed in Laptop and PDA for both polarization of the transmitter's antenna (antenna in vertical and horizontal position). The worst case of emissions was reported.

For spurious emissions attenuation, the substitution method was used. On each frequency where the Field Strength was found above 63.4 dBuV/m (which corresponds to ERP = -33 dBm), the EUT was substituted by a reference antenna (half-wave dipole - below 1 GHz, or Horn antenna - above 1GHz), connected to a signal generator. The signal generator output was adjusted to obtain the same reading as from EUT. The ERP/EIRP at the spurious emissions frequency was calculated as in section 3. The spurious emissions attenuation was calculated as the difference between ERP/EIRP at the fundamental frequency (see section 3) and at the spurious emissions frequency.

6.2 Test Equipment

EMCO 3115 Horn Antennas
HP 8566B Spectrum Analyzer
Tektronix 2784 Spectrum Analyzer
Low Pass Filter
Preamplifiers

6.3 Test Results

Test Result:	Complies, refer to the attached data sheets

7.0 Line Conducted Emissions

FCC 15.107

7.1 Test Procedure

Test procedure described in the ANSI C63.4 Standard was employed. The Laptop was connected to the AC line through the LISNs. Both HOT and NEUTRAL leads were tested.

7.2 Test Equipment

HP8568A Spectrum Analyzer with 85650 Quasi-peak adapter
Solar Electronics 8028-50-TS-24-BNC LISNs

7.3 Test Results

See attached plot.

FREQUENCY [MHz]

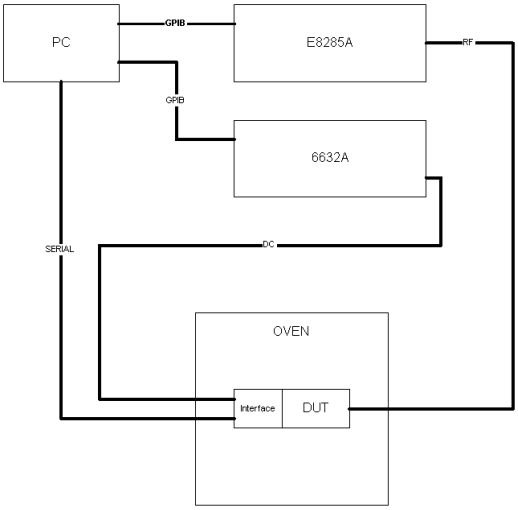
8.0 Frequency Stability vs Temperature

FCC 2.1055

8.1 Test Procedure



Test setup block diagram

The AIRCARD 555 was placed inside the temperature chamber. After the temperature stabilized for approximately 20 minutes, the transmitting frequency was recorded.

8.2 Test Equipment

Aglient e8285A CDMA Mobile Station Test Set
HP 6632A DC Power Supply

8.3 Test Results

Test Result:	Complies. Emission attenuation on the band-edges frequencies of the frequency block is not affected by the measured frequency instability.

Transmitting Frequency: 1880 MHz

Temperature (°C)	Frequency (MHz)	Difference (Hz)
-30	1880.000002	2.43
-20	1879.999995	-5.02
-10	1879.999991	-9.32
0	1880.000007	7.50
10	1879.999997	-2.69
20	1880.000008	8.29
30	1880.000003	2.63
40	1879.999996	-3.55
50	1880.000002	1.59

Note: The measured frequency stability vs. temperature for the Cellular band is identical (% difference) to the above table since the transmitting frequency is locked to the same oscillator.

9.0 Frequency Stability vs Voltage

FCC 2.1055

9.1 Test Procedure

For the test setup block diagram, refer to sec. 8.
The Aircard 555 was connected to a DC Power Supply. The voltage was set to 115% of the nominal value and was then decreased to 85% of the nominal value. The output frequency was recorded for each voltage setting.

9.2 Test Equipment

Aglient e8285A CDMA Mobile Station Test Set
HP 6632A DC Power Supply

9.3 Test Results.

Test Result:	Complies. Emission attenuation on the band-edges frequencies of the frequency block is not affected by the measured frequency instability.

Transmitting Frequency: 837 MHz

Vcc, Volts	Frequency (MHz)	Difference (Hz)
4.0	836.999995	-5.08
6.0	837.000006	6.23

Transmitting Frequency: 1880 MHz

Vcc, Volts	Frequency (MHz)	Difference (Hz)
4.0	1880.000003	3.31
6.0	1880.000002	2.39

10.0 Miscellaneous Comments

For setup photos see separate file “Set Up Photos”
