

FCC OET BULLETIN 65 SUPPLEMENT C 01-01 IEEE STD 1528:2003

SAR EVALUATION REPORT

For

Intel® Centrino® Advanced-N6205 (Tested inside of Panasonic Tablet PC CF-C1)

> MODEL NUMBER: WL11A FCC ID: ACJ9TGWL11A

REPORT NUMBER: 11J13739-3

ISSUE DATE: May 5, 2011

Prepared for

PANASONIC CORPORATION OF NORTH AMERICA ONE PANASONIC WAY, 4B-8 SECAUCUS, NEW JERSEY 07094, U.S.A.

Prepared by

1. ATTESTATION OF TEST RESULTS

Company name:	PANASONIC CORPORATION OF NORTH AMERICA							
	ONE PANASONIC WAY, 4B-8							
	SECAUCUS, NEW JERSEY 07094, U.S.A.							
EUT Description:	Intel® Centrino® Adv	anced-N6205 (Tested inside of Panasonic Tablet P	C CF-C1)					
Model number:	WL11A							
Device Category:	Portable							
Exposure category:	General Population/U	Incontrolled Exposure						
Date of tested:	March 31 – April 5, 20	011 & April 27– May 4, 2011						
			Limit					
FCC Rule Parts	Freq. Range [MHz]	The Highest 1g SAR	(W/kg)					
	2400 - 2483 5	0.135 W/kg						
15 247	2400 - 2400.0	Primary Landscape						
10.247	5725 - 5850	0.166 W/kg						
	5725 - 5650	Primary Landscape						
	5150 - 5250	0.091 W/kg	16					
	0100 - 0200	Primary Landscape	1.0					
15 407	5250 - 5350	0.200 W/kg						
10.407	5250 - 5550	Primary Landscape						
	5470 - 5725	0.156 W/kg						
	5470 - 5725	Primary Landscape

OET Bulletin 65 Supplement C 01-01,								
			Pass					

IEEE STD 1528: 2003

Compliance Certification Services (UL CCS) tested the above equipment in accordance with the requirements set forth in the above standards. All indications of Pass/Fail in this report are opinions expressed by UL CCS based on interpretations and/or observations of test results. Measurement Uncertainties were not taken into account and are published for informational purposes only. The test results show that the equipment tested is capable of demonstrating compliance with the requirements as documented in this report.

Note: The results documented in this report apply only to the tested sample, under the conditions and modes of operation as described herein. This document may not be altered or revised in any way unless done so by UL CCS and all revisions are duly noted in the revisions section. Any alteration of this document not carried out by UL CCS will constitute fraud and shall nullify the document. This report must not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, any agency of the Federal Government, or any agency of any government (NIST Handbook 150, Annex A). This report is written to support regulatory compliance of the applicable standards stated above.

Approved & Released For UL CCS By:

enay Shih

Sunny Shih Engineering Team Leader Compliance Certification Services (UL CCS) Tested By:

the start and the

Chenghua Yang and Chakrit Thammanavarat RF Engineer Compliance Certification Services (UL CCS)

2. TEST METHODOLOGY

The tests documented in this report were performed in accordance with FCC OET Bulletin 65 Supplement C Edition 01-01, IEEE STD 1528:2003, January 1, 2011 and the following KDB Procedures.

- 248227 SAR measurement procedures for 802.11a/b/g transmitters
- 447498 D01 Mobile Portable RF Exposure v04

3. FACILITIES AND ACCREDITATION

The test sites and measurement facilities used to collect data are located at 47173 Benicia Street, Fremont, California, USA.

UL CCS is accredited by NVLAP, Laboratory Code 200065-0. The full scope of accreditation can be viewed at <u>http://www.ccsemc.com</u>

Page 5 of 43

4. CALIBRATION AND UNCERTAINTY

4.1.MEASURING INSTRUMENT CALIBRATION

The measuring equipment utilized to perform the tests documented in this report has been calibrated in accordance with the manufacturer's recommendations, and is traceable to recognized national standards.

*Note: Per KDB 450824 D02 requirements for dipole calibration, UL CCS has adopted two years calibration intervals. On annual basis, each measurement dipole has been evaluated and is in compliance with the following criteria:

- 1. There is no physical damage on the dipole
- 2. System validation with specific dipole is within 10% of calibrated value.
- 3. Return-loss is within 20% of calibrated measurement (test data on file in UL CCS)
- 4. Impedance is within 5Ω of calibrated measurement (test data on file in UL CCS)

6. SYSTEM SPECIFICATIONS

The DASY4 system for performing compliance tests consists of the following items:

- A standard high precision 6-axis robot (Stäubli RX family) with controller, teach pendant and software. An arm extension for accommodating the data acquisition electronics (DAE).
- A dosimetric probe, i.e., an isotropic E-field probe optimized and calibrated for usage in tissue simulating liquid. The probe is equipped with an optical surface detector system.
- A data acquisition electronics (DAE) which performs the signal amplification, signal multiplexing, AD-conversion, offset measurements, mechanical surface detection, collision detection, etc. The unit is battery powered with standard or rechargeable batteries. The signal is optically transmitted to the EOC.
- The function of the measurement server is to perform the time critical tasks such as signal filtering, control of the robot operation and fast movement interrupts.
- A probe alignment unit which improves the (absolute) accuracy of the probe positioning.
- A computer operating Windows 2000 or Windows XP.
- DASY software.
- Remote controls with teach pendant and additional circuitry for robot safety such as warning lamps, etc.
- The SAM twin phantom enabling testing left-hand and right-hand usage.
- The device holder for handheld mobile phones.
- Tissue simulating liquid mixed according to the given recipes.
- Validation dipole kits allowing validating the proper functioning of the system.

8. TISSUE DIELECTRIC PARAMETERS

The simulating liquids should be checked at the beginning of a series of SAR measurements to determine of the dielectric parameters are within the tolerances of the specified target values. For frequencies in 300 MHz to just under 2 GHz, the measured conductivity and relative permittivity should be within \pm 5% of the target values. For frequencies in the range of 2–3 GHz and above the measured conductivity should be within \pm 5% of the target values. The measured relative permittivity tolerance can be relaxed to no more than \pm 10%.

Reference Values of Tissue Dielectric Parameters for Head & Body Phantom

The body tissue parameters that have not been specified in P1528 are derived from the tissue dielectric parameters computed from the 4-Cole-Cole equations and extrapolated according to the head parameters specified in IEEE Standard 1528.

Target Frequency (MHz)	He	ad	Body		
Target Trequency (Miliz)	٤ _r	σ (S/m)	٤ _r	σ (S/m)	
150	52.3	0.76	61.9	0.8	
300	45.3	0.87	58.2	0.92	
450	43.5	0.87	56.7	0.94	
835	41.5	0.9	55.2	0.97	
900	41.5	0.97	55	1.05	
915	41.5	0.98	55	1.06	
1450	40.5	1.2	54	1.3	
1610	40.3	1.29	53.8	1.4	
1800 – 2000	40	1.4	53.3	1.52	
2450	39.2	1.8	52.7	1.95	
3000	38.5	2.4	52	2.73	

(ε_r = relative permittivity, σ = conductivity and ρ = 1000 kg/m³)

Reference Values of Tissue Dielectric Parameters for Body Phantom (for 3000 MHz – 5800 MHz)

In the current guidelines and draft standards for compliance testing of mobile phones (i.e., IEEE P1528, OET 65 Supplement C), the dielectric parameters suggested for head and body tissue simulating liquid are given only at 3.0 GHz and 5.8 GHz. As an intermediate solution, dielectric parameters for the frequencies between 5 to 5.8 GHz were obtained using linear interpolation (see table below).

SPEAG has developed suitable head and body tissue simulating liquids consisting of the following ingredients: de-ionized water, salt and a special composition including mineral oil and an emulgators. Dielectric parameters of these liquids were measured suing a HP 8570C Dielectric Probe Kit in conjunction with HP 8753ES Network Analyzer (30 kHz – 6G Hz). The differences with respect to the interpolated values were well within the desired \pm 5% for the whole 5 to 5.8 GHz range.

Target Frequency (MHz)	He	ad	Body		
Target Frequency (Miriz)	ε _r	σ (S/m)	٤ _r	σ (S/m)	
5000	36.2	4.45	49.3	5.07

The conductivity (σ) can be given as:									
$\sigma = \omega \varepsilon_0 e'' = 2 \pi f \varepsilon_0 e''$									
where $f = ta$	arget f * 10 ⁶								

£₀ = 8.854 * 10⁻¹²

9. SYSTEM VERIFICATION

The system performance check is performed prior to any usage of the system in order to verify SAR system measurement accuracy. The system performance check verifies that the system operates within its specifications of $\pm 10\%$.

Measurement Conditions

- The measurements were performed in the flat section of the SAM twin phantom filled with Head or Body simulating liquid of the following parameters.
- The DASY4 system with an Isotropic E-Field EX3DV4 SN 3749 was used for the measurements.
- The dipole was mounted on the small tripod so that the dipole feed point was positioned below the center marking of the flat phantom section and the dipole was oriented parallel to the body axis (the long side of the phantom). The standard measuring distance was 10 mm (above 1 GHz) and 15 mm (below 1 GHz) from dipole center to the simulating liquid surface.
- The coarse grid with a grid spacing of 15 mm was aligned with the dipole.
 For 5 GHz band The coarse grid with a grid spacing of 10 mm was aligned with the dipole.
- Special 7x7x7 fine cube was chosen for cube
- Distance between probe sensors and phantom surface was set to 3 mm.
 For 5 GHz band Distance between probe sensors and phantom surface was set to 2.5 mm
- The dipole input power (forward power) was 100 mW
- The results are normalized to 1 W input power

10. SAR MEASUREMENT PROCEDURES

Step 1: Power Reference Measurement

The Power Reference Measurement and Power Drift Measurements are for monitoring the power drift of the device under test in the batch process. The Minimum distance of probe sensors to surface determines the closest measurement point to phantom surface. The minimum distance of probe sensors to surface is 2.1 mm. This distance cannot be smaller than the Distance of sensor calibration points to probe tip as defined in the probe properties (for example, 1.2 mm for an EX3DV3 probe type).

Step 2: Area Scan

The Area Scan is used as a fast scan in two dimensions to find the area of high field values, before doing a fine measurement around the hot spot. The sophisticated interpolation routines implemented in DASY4 software can find the maximum locations even in relatively coarse grids. When an Area Scan has measured all reachable points, it computes the field maximal found in the scanned area, within a range of the global maximum. The range (in dB) is specified in the standards for compliance testing. For example, a 2 dB range is required in IEEE Standard 1528, EN 50361 and IEC 62209 standards, whereby 3 dB is a requirement when compliance is assessed in accordance with the ARIB standard (Japan). If only one Zoom Scan follows the Area Scan, then only the absolute maximum will be taken as reference. For cases where multiple maximums are detected, the number of Zoom Scans has to be increased accordingly.

Step 3: Zoom Scan

Zoom Scans are used to assess the peak spatial SAR values within a cubic averaging volume containing 1 g and 10 g of simulated tissue. The Zoom Scan measures \geq 7 x 7 x 9 points within a cube whose base faces are centered on the maxima found in a preceding area scan job within the same procedure. When the measurement is done, the Zoom Scan evaluates the averaged SAR for 1 g and 10 g and displays these values next to the job's label.

Step 4: Power drift measurement

The Power Drift Measurement measures the field at the same location as the most recent power reference measurement within the same procedure, and with the same settings. The Power Drift Measurement gives the field difference in dB from the reading conducted within the last Power Reference Measurement. This allows a user to monitor the power drift of the device under test within a batch process. The measurement procedure is the same as Step 1.

Step 5: Z-Scan

The Z Scan measures points along a vertical straight line. The line runs along the Z-axis of a onedimensional grid. In order to get a reasonable extrapolation, the extrapolated distance should not be larger than the step size in Z-direction.

Page 22 of 43

11. RF OUTPUT POWER VERIFICATION

The following procedures had been used to prepare the EUT for the SAR test. The client provided a special driver and program, Intel DRTU v1.3.12-0263, which enable a user to control the frequency and output power of the module.

11.1. RF OUTPUT POWER FOR 2.4 GHZ BAND

2.4 GHz Band	.4 GHz Band

12. SUMMARY OF SAR TEST RESULTS

SUMMARY OF SAR TEST CONFIGURATIONS

Configuration	Antenna-to-User distance	SAR Require	Comments
Laptop mode: Lap-held	92 mm From Main (Chain A)- to-user	No	This is not the most conservative antenna-to-user distance at edge mode.
	86 mm from Aux (Chain B)-to- user	Yes	SAR evaluation
Bottom Face	41 mm From Main (Chain A)- to-user	Yes	
	38 mm From Aux (Chain B)- to-user	Yes	
Edge - Primary Landscape	70 mm From Main (Chain A)- to-user	No	This is not the most conservative antenna-to-user distance at edge mode. Per According to KDB 447498 4) b) ii) (2)
	65 mm From Aux (Chain B)- to-user	Yes	SAR evaluation This is the most conservative antenna-to-user distance at edge mode.
Edge - Secondary Landscape	126 mm From Main (Chain A)- to-user	No	This is not the most conservative antenna-to-user distance at edge mode. According to KDB 447498 4) b) ii) (2), SAR is required only for the edge with the most conservative exposure conditions.
	134 mm From Aux (Chain B)- to-user	No	This is not the most conservative antenna-to-user distance at edge mode. According to KDB 447498 4) b) ii) (2), SAR is required only for the edge with the most conservative exposure conditions.
Edge - Primary Portrait	< 2 mm from Main (Chain A) antenna to edge	No	Main (Chain A) antenna is disabled by software at this configuration.
Edge - Secondary Portrait	< 2 mm from Aux (Chain B) antenna to edge	No	Aux (Chain B) antenna is disabled by software at this configuration.

WORST-CASE SAR TEST PLOTS

<u>2.4 GHZ</u>

Date/Time: 4/28/2011 5:14:49 PM

Test Laboratory: UL CCS

Edges Primary Landscape

DUT: Panasonic; Type: Tablet; Serial: 1BKKSA00017

Communication System: 802.11b/g 2.4GHz; Frequency: 2437 MHz;Duty Cycle: 1:1 Medium parameters used (interpolated): f = 2437 MHz; σ = 2.001 mho/m; ϵ_r = 51.785; ρ = 1000 kg/m³ Phantom section: Flat Section

Room Ambient Temperature: 24.0 deg. C; Liquid Temperature: 23.0 deg. C

DASY5 Configuration:

- Area Scan setting - Find Secondary Maximum Within: 2.0 dB and with a peak SAR value greater than 0.0012W/kg

- Probe: EX3DV4 - SN3686; ConvF(6.86, 6.86, 6.86); Calibrated: 1/24/2011

- Sensor-Surface: 2.5mm (Mechanical Surface Detection)

- Electronics: DAE4 Sn1239; Calibrated: 11/17/2010

- Phantom: ELI 4.0; Type: QDOVA001BB; Serial: 1099

- Measurement SW: DASY52, Version 52.6 (1);SEMCAD X Version 14.4.2 (2595)

802.11b_Ant-Aux Ch-6/Area Scan (10x13x1): Measurement grid: dx=15mm, dy=15mm

Info: Interpolated medium parameters used for SAR evaluation.

Maximum value of SAR (measured) = 0.148 mW/g

802.11b_Ant-Aux Ch-6/Zoom Scan (7x7x9)/Cube 0: Measurement grid: dx=5mm, dy=5mm, dz=3mm

Reference Value = 2.249 V/m; Power Drift = -0.02 dB Peak SAR (extrapolated) = 0.487 W/kg SAR(1 g) = 0.135 mW/g; SAR(10 g) = 0.054 mW/g Info: Interpolated medium parameters used for SAR evaluation. Maximum value of SAR (measured) = 0.185 mW/g

5.2 GHZ

Date/Time: 5/4/2011 10:48:39 PM

Test Laboratory: UL CCS

Edges - Primary Landscape (Aux)

DUT: Panasonic; Type: Tablet; Serial: 1BKKSA00017

Communication System: 802.11a 5.2-5.3GHz; Frequency: 5200 MHz;Duty Cycle: 1:1 Medium parameters used: f = 5200 MHz; σ = 5.268 mho/m; ϵ_r = 50.074; ρ = 1000 kg/m³ Phantom section: Flat Section

Room Ambient Temperature: 25.0 deg. C; Liquid Temperature: 24.0 deg. C

DASY5 Configuration:

- Area Scan setting Find Secondary Maximum Within: 2.0 dB and with a peak SAR value greater than 0.0012W/kg
- Probe: EX3DV4 SN3686; ConvF(3.98, 3.98, 3.98); Calibrated: 1/24/2011

- Sensor-Surface: 2.5mm (Mechanical Surface Detection)

- Electronics: DAE4 Sn1239; Calibrated: 11/17/2010
- Phantom: ELI 4.0; Type: QDOVA001BB; Serial: 1099
- Measurement SW: DASY52, Version 52.6 (1);SEMCAD X Version 14.4.2 (2595)

802.11a_5.2GHz/Ant Aux_Ch 40/Area Scan (16x20x1): Measurement grid: dx=10mm, dy=10mm

Maximum value of SAR (measured) = 0.166 mW/g

802.11a_5.2GHz/Ant Aux_Ch 40/Zoom Scan (7x7x9)/Cube 0: Measurement grid: dx=4mm, dy=4mm, dz=2.5mm

Reference Value = 5.755 V/m; Power Drift = 0.0091 dBPeak SAR (extrapolated) = 0.302 W/kg

SAR(1 g) = 0.091 mW/g; SAR(10 g) = 0.020 mW/g Maximum value of SAR (measured) = 0.157 mW/g

Page 34 of 43

5.3 GHZ

Date/Time: 5/5/2011 12:09:25 AM

Test Laboratory: UL CCS

Edges - Primary Landscape (Aux)

DUT: Panasonic; Type: Tablet; Serial: 1BKKSA00017

Communication System: 802.11a 5.2-5.3GHz; Frequency: 5310 MHz;Duty Cycle: 1:1 Medium parameters used (interpolated): f = 5310 MHz; σ = 5.465 mho/m; ϵ_r = 49.896; ρ = 1000 kg/m³ Phantom section: Flat Section

Room Ambient Temperature: 25.0 deg. C; Liquid Temperature: 24.0 deg. C

DASY5 Configuration:

- Area Scan setting Find Secondary Maximum Within: 2.0 dB and with a peak SAR value greater than 0.0012W/kg
- Probe: EX3DV4 SN3686; ConvF(3.7, 3.7, 3.7); Calibrated: 1/24/2011
- Sensor-Surface: 2.5mm (Mechanical Surface Detection), Sensor-Surface: 2.5mm (Fix Surface)
- Electronics: DAE4 Sn1239; Calibrated: 11/17/2010
- Phantom: ELI 4.0; Type: QDOVA001BB; Serial: 1099
- Measurement SW: DASY52, Version 52.6 (1);SEMCAD X Version 14.4.2 (2595)

802.11n HT40_5.3GHz/Ant Aux_Ch 62/Area Scan (12x14x1): Measurement grid: dx=10mm,

dy=10mm Info: Interpolated medium parameters used for SAR evaluation. Maximum value of SAR (measured) = 0.293 mW/g

802.11n HT40_5.3GHz/Ant Aux_Ch 62/Zoom Scan (7x7x9)/Cube 0: Measurement grid: dx=4mm,

dy=4mm, dz=2.5mm Reference Value = 7.658 V/m; Power Drift = 0.20 dB Peak SAR (extrapolated) = 0.735 W/kg SAR(1 g) = 0.200 mW/g; SAR(10 g) = 0.060 mW/g Info: Interpolated medium parameters used for SAR evaluation. Maximum value of SAR (measured) = 0.355 mW/g
