### 3 Description of Equipment Under Test

The Sierra Wireless Inc. model MC8790 is a multi-band wireless modem operating on the GSM/GPRS/EDGE/UMTS network. In the US and Canada, only Cellular and PCS bands are used for GSM/GPRS/UMTS operation, so this test report only contains data for these two bands (850MHz and 1900MHz).

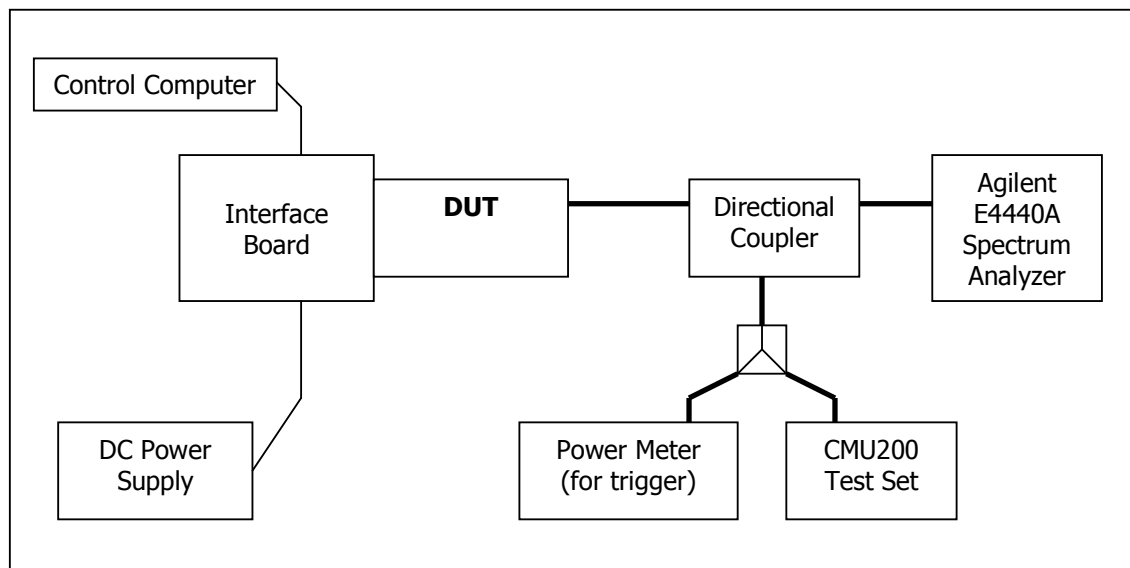

### 4 RF Power Output

FCC 2.1046

#### 4.1 Test Procedure

The transmitter output was connected to a Rohde & Schwarz CMU200 Test Set and configured to operate at maximum power in a call. The power was measured using the spectrum analyzer at three equally spaced operating frequencies for each band. The RBW was set to 300 KHz for the GSM and EDGE measurements, and 5MHz for the WCDMA measurements. The spectrum analyzer was set to measure the RF output power with the cable and coupler losses accounted for.

## 5 Occupied Bandwidth

FCC 2.1049

### 5.1 Test Procedure

The transmitter output was connected to a calibrated coaxial cable and coupler, the other end of which was connected to a spectrum analyzer. The occupied bandwidth (defined as the 99% Power Bandwidth) was measured with the spectrum analyzer at the 3 frequencies in each band. The -26dB bandwidth was also measured and recorded.

### 6 Out of Band Emissions at Antenna Terminals

FCC 22.901(d), 22.917, 24.238(a)

#### Out of Band Emissions:

The mean power of emissions must be attenuated below the mean power of the unmodulated carrier (P) on any frequency outside the frequency band by at least  $(43 + 10 \log P)$  dB, in this case, -13dBm.

#### **6.1 Test Procedure**

The RF output of the transmitter was connected to a spectrum analyzer through a calibrated coaxial cable. Sufficient scans were taken to show the out-of-band Emissions, if any, up to 10<sup>th</sup> harmonic. The EUT was scanned for spurious emissions from 1MHz to 20GHz with sufficient bandwidth and video resolution. Data plots are included. The measurement cable path loss at 20GHz (including an attenuator) was 10dB. Multiple sweeps were recorded in maximum hold mode using a peak detector to ensure that the worst-case emissions were caught.

## 8 Frequency Stability Versus Temperature

### FCC 2.1055

#### 8.1 Summary of Results

The MC8790 Frequency Stability versus temperature meets the requirement of being within  $\pm 0.1$ ppm of the received base station frequency.

#### 8.2 Test Procedure

The MC8790 was placed inside the temperature chamber. The transmitting frequency error is measured at 25 degrees C, then the temperature is set to +50 degrees C and allowed to stabilize. After sufficient soak time, the transmitting frequency error is measured. The temperature is decreased by 10 degrees, allowed to stabilize and soak, then the measurement is repeated. This is repeated until -30 degrees C is completed. The process is then repeated back up to +50 degrees C. Frequency metering included internal averaging of the CMU200 to stabilize the reading. Reference power supply voltage for these tests is 3.3 volts.

## 9 Frequency Stability Versus Voltage

### FCC 2.1055

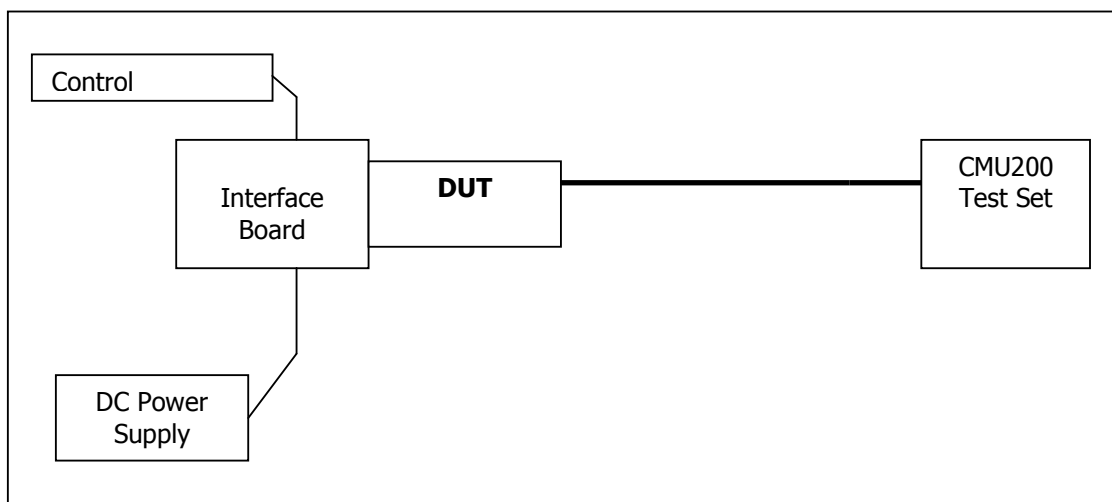

#### 9.1 Summary of Results

The EUT is specified to operate with a supply voltage of between 2.9 VDC and 3.6 VDC with a nominal voltage of 3.3 VDC. It meets the frequency stability limit of less than 0.1ppm when supply voltage varies within the specified limits. Operation is prohibited by firmware while the DC supply voltage is out of the specified range.

#### 9.2 Test Procedure

The MC8790 was connected to a DC Power Supply and a UMTS test set (CMU 200) with frequency error measurement capability. The power supply output is adjusted to the test voltage as measured at the input terminals to the module while transmitting. A voltmeter was used to confirm the terminal voltage. The peak frequency error is recorded (worst case). The test voltages are 2.9 volts to 3.6 volts.
